HOW MUCH DO YOU REALLY SEE?

See Page 248

This Wonderful VIX Engine Humidifier Invention Will Give Your Auto a Completely New All Around Performance in 30 Minutes

New Pickup

No matter how quick your pickup may now be—this VIX Humidifier will positively make it quicker. Your engine will flash ahead with the slightest touch of the accelerator pedal. Your car will screech around corners with amazing swiftness and complete safety in and out of traffic.

New Power

This VIX Humidifier improves the power of any engine to approximately the equivalent of another cylinder added. You can fly over hills, in plain, that you always chafed at on before. A scientific humidifying treatment of the engine fuel does it.

New Speed

This VIX humidifying process gives the engine more speed. Your car will be faster, with lightning-flash acceleration, in passing other cars, and top speed increased several miles per hour. A new top speed for every engine, from a Ford to a Rolls-Royce.

New Smoothness

Glasslike smoothness—less vibration at both low and high speed—the buff of the engine is made less audible than the switch of engine speed. This VIX invention makes the motor run softer, with quieter valves and tappets, and a cushioned explosion that gives you the utmost in vibrationless driving comfort.

New Mileage

This is not a fake gas saver. But scientific engine humidification DOES GIVE more mileage. Gains up to 30%, 40%, and 50% are regularly reported. The average gain for all cars is 20% minimum. Humidifying the auto engine effects more perfect combustion, and a NEW mileage is attained.

Uses Lowest Price Gas with Better Than Highest Price Gas Results

An Engineering Achievement of Outstanding Importance
PATENTED AND TRADE-MARKED IN 109 NATIONS

An Auto Engine Humidifier

Its Function Is The Same That Makes Autos Run The Wonderful Way They Do In The Cold Damp Evening Air Or In Foggy Or Rainy Weather

Not A Joke Gas Saver

Nothing Else Like It The World Over—Now Or Ever Before Fits All Autos Any Average Busy Man Can Install In 30 Minutes

Decarbonizes Engine—Saves Carbon-Caused Repair Bills

When you drive down the road at night, many times you notice a car ahead of you belching red-hot sparks from the exhaust outlet pipe. That's because the moisture from the atmosphere taken into the engine through the carburetor is disintegrating the hard carbon, and it is coming out of the exhaust in red-hot sparks.

This VIX Humidifier invention scientifically sends a constant stream of moisture into the engine, all the time, which completely decarbonizes the engine and keeps it clean, everlastingly.

Kills carbon knocks, stops engine overheating, cures sticky valves, lubricates cylinders, kills carbon monoxide gas, and the expense of frequent valve grinding and spark plug cleaning. Everyone knows the average car owner spends all the way from \$25.00 to \$100.00 a year in engine repairs, due to the bad effects of hard carbon. The VIX saves all carbon-caused repair bills. Fits every auto, truck—is easily attached—works alike, winter and summer—is easily changed from one car to another. Mail coupon below or postal request.

Pays Agents Big Quick Cash Profits

Chosen Territory available. I want to appoint County, State, Province, National, Salesman and Distributor, and General Agencies to make \$350.00 to \$1,500.00 month, filling the great demand bound to arise for this wonderful invention wherever introduced. One Distributor already made profits of \$1,000.00 in 2-3 months. BIG MONEY can be made FITTING Engines with VIX. Startling, stunning, convincing demonstrations make sales EASY. Write quick for all details: full proof, ALL SENT FREE, Mail FREE VIX Offer Coupon TODAY. Or send postal.

Gives Substantial Mileage Gain Pays For Itself Over and Over Each Year

By a scientific process of mixing humidified air or vapor moisture with engine fuel, this VIX invention brings about more perfect combustion. This better combustion gives a much smoother running engine, with far greater power, vastly quicker acceleration (pickup), and several miles per hour more top speed. Like coal burns better when it is sprinkled with water before thrown into the fire, so does this process of mixing moisture with engine fuel make the fuel burn up more completely. Thus you get more miles per gallon of gas and oil.

Remarkable mileage gains have been reported to us, up to as high as 100%. The average gain for all cars reported to us is 20%. The function of this VIX Humidifier permits the use of lowest priced gas, with better than highest priced gas results. That means a saving of from 3c to 5c a gallon every time you fill your gas tank. The doing away with carbon-caused repair bills. The money saved by cheaper gas, plus mileage gain, pays for this VIX Humidifier invention over and over again every year.

The Inventor and Manufacturer will furnish at his risk, direct from Factory, a suitable VIX Model on trial for you to try out on your own car.

Fill out and mail the coupon QUICK for full details and FREE VIX offer. Or send postal request. ALL SENT FREE.

Three Chicago food experts inspect a delightful new food that is revolutionizing the doughnut business.

Here's an Amazing New Business That Pays \$1,000 a Month Up to.....

Here is a surprising new opportunity. Now you can immediately become the owner of a big business that is paying others from \$75 up to \$250 a week. There is no "Red Tape"—no delay. Wherever you live there are quick, easy profits waiting for you to grab them. Just mail the coupon for full details.

Individual Plans to Fit Every Need

FULL TIME

You can start a Brown Booby shop with floor space as little as 6 by 8 feet. Sell retail and wholesale.

Thus, Miss. Fla., made \$3,000 his first 3 months.

PART TIME

Invest a few dollars in this new business and get someone else to run it for you. A few hours of your time each week can easily bring you \$50 up to \$150 a week extra cash.

SPARE TIME

Start at home. Make money like Mrs. Nelson, Ill., who sold 50 dozen Brown Bobbies at retail in one week, then went out to triple her profits through wholesale business.

MEN, this is absolutely new! A real red-hot money-making opportunity! Something every red-blooded man has always longed for. It's a chance to jump into business for yourself and make more money every week than the average man makes in a month!

Surprising, yes, almost incredible as it may sound, we actually start you in a **proven business!** The first day's profits often run from \$18 to \$55—and a business of \$350 to \$600 the first month is not exceptional for ambitious men or women.

A Sensational Big-Money Plan

There is just one thing you need to make a "go" of this business, and that is the ambition to make real money. We give you all the plans, advice and help needed to make a big success right from the jump. We supply you with the equipment to make an amazing new food—a **greaseless** doughnut baked by electricity! You sell to homes, bakeries, delicatessens, groceries, restaurants, etc., at a profit of 150% to 600%! No wonder the dollars simply pour in!

A New Food Secret

The **greaseless** doughnut is altogether novel and unique. It's a crisp, flaky, delicious new kind of doughnut cooked without one drop of oil or grease. Easily digested by everyone. More appetizing than old-style doughnuts ever were. Yet costs you less to make. This new business is copyrighted under the trade name "BROWN BOBBY," so there is no competition.

Everyone likes doughnuts. Millions of old-style doughnuts are sold every day. Now you can bake and sell the perfect doughnut—the toothsome **BROWN BOBBY greaseless** doughnut that sells four times as fast as any other.

Start At Once—Anywhere

In this limited space I am able to suggest only the bare possibilities. The details are even more sensational than the facts given here can indicate. I am looking for sincere, ambitious, wide-awake men. I offer such men a plan that is a real eye-opener. The first week's profits usually amount to more than your entire investment. After that it is up to you entirely whether you will make \$300 or \$1,000 a month clear profit.

Men and women start in this business daily. You do not obligate yourself in any way by mailing the attached coupon. So get the details of this amazing new idea at once. Decide for independence! Fill out and mail the coupon today—**now—THIS MINUTE!**

ANNOUNCING A NEW TELETYPEWRITER SERVICE

THE BELL SYSTEM offers to the public a new Teletypewriter Service. Any subscriber to this service may be connected, through the teletypewriter "central," to any other subscriber, whether he be around the corner or across the continent. Subscribers can type back and forth by wire, for short or long periods, just as they now hold conversations by telephone.

This important development for the business world parallels the other progress which is constantly being made in the telephone art.

Messages, inquiries, reports—typed in one office—are instantly and accurately reproduced on the other subscriber's teletypewriter. Typewritten copies made by both sending and receiving machines are available for permanent records. The principal feature of this new service, which distinguishes it from existing private line

teletypewriter service, is that any subscriber may ask for any other subscriber and be connected immediately.

Further information about this development in nation-wide communication will be furnished gladly by your local Telephone Business Office.

- Teletypewriter Service provides two-way communication. 237
- Speed of connection is as fast as telephone service. 240
- A typewritten record, one or more copies, is produced simultaneously by both sending and receiving machines. 280
- Material transmitted may be recorded on any forms if desired. 232
- Teletypewriters are like ordinary typewriters in appearance. 251
- Teletypewriters can be operated by anyone who can operate a typewriter. 215
- You can use Teletypewriter Service any time you need it. 264
- A most economical form of record communication. 271

PRESWOOD

TRADE MARK REG. U. S. PAT. OFF.

tempered to super-toughness
means better concrete at lower cost

Mighty walls and columns, floors, arches—more and more of them prove that Tempered Presdwood* is ideal for structural forms, producing better concrete at lower cost.

Many leading engineers, builders and architects now use Tempered Presdwood*:

toughened, hardened by tempering, just as steel is tempered.

The many practical advantages of Tempered Presdwood* answer the endless demand for faster, better, cheaper concrete.

You'll want the whole story. Just mail the coupon today.

PRESDWOOD

STRUCTURAL INSULATION-INSULATING LATH-QUARTERBOARD*-Cushioned FLOORING

When writing to advertisers please mention Popular Mechanics

Tempered Presdwood* improves quality, cuts costs

Smooth finished concrete—no fins, no marks, no costly finishing.

Impervious to moisture, Presdwood* makes tight forms, insuring concrete of maximum density.

Use forms many times. Easy to put up, to strip, to clean.

Eliminate usual sheathing. Form lumber reduced one-half. Light forms, easy to handle.

Auto Service Men and Auto Dealers! *Here's a new Opportunity!*

M. I. A. "JOB-WAY" TRAINING Is the Only Answer

M. I. A. Training has been successful for over ten years. Through this Training—complete, practical, up-to-date—thousands of men have become Expert Auto Service Men—making good money, holding good jobs. When you enroll for this training, you do not have to leave your job or your home. Your training is brought right to you—on the job, and in your home. You earn while you learn and you give up no time from income producing hours. And "Job-Way" training sticks. It never gets away. Every M. I. A. Trained Service man can do two to three times the number of jobs per day that the ordinary "mechanic" can do. And he does them correctly—every time!

Low Cost—Start Now

The Cost of M. I. A. "Job-Way" training is very low. A small deposit—so little the student never misses it—will start him. The payments are easy. Anyone can make them without scrimping. Get started, now.

FACTS FREE

Simply clip the coupon. It will bring all the details—complete information on M. I. A. Training; exactly what it is—how it is studied—how it is applied—why every man who completes it, never has to worry about his income and his progress—and why every dealer who urges his service men to enroll for M. I. A. training speeds up his business to an almost unbelievable degree. Clip the coupon. Mail it now.

Motor Institute of America
Motor Institute Building
Dept. 5162 Evanston, Ill.

Good Pay for Service Men—and more Profit for Auto Dealers Who Meet the New Situation In the RIGHT WAY!

The auto business has changed. Now Motor Cars and Trucks are finely engineered pieces of machinery—designed and built to meet a demand for performance unthought of 10 years ago. And the service requirements of these cars are just as different as the service needs of 10 years ago. A new type of dealer service is demanded. A new type of service man is needed. The Dealer, and the service man who recognizes the difference between yesterday and today in the auto business, has an immediate, golden future ahead of him.

The New DEALER SERVICE

The car dealer, regardless of what car he sells, must be able to give expert service on all makes of cars. His shop must be so manned that any repair job on any car can be done just as the factory would do that job. The dealer who offers such service will make service profits and car SALES that will exceed even his greatest ambitions.

The New SERVICE MAN

Today, and in the future, the Service Man can't be just a "mechanic"—just a "fixer." He must understand automobiles; be able to repair or adjust all service troubles, quickly and efficiently. He must work with his head more than with his hands. Such service men get paid for what they know, even more than for what they do. They're invaluable. They never have to look for work.

Jobs seek them. They get big pay, and hold the better jobs.

When they cut the pay roll

~will you be hunting for another job?

usually comes like a bolt the blue—
 u are called into the man-
 office—he looks troubled,
 id—reluctantly he explains
 business isn't holding up, he
 fore men than he needs. And
 can he do?

Idently it dawns on you that
 ure being politely told you're
 ought!

o more security for you—no
 steady money coming in—
 your pocket, perhaps, only
 ch to last out the month!
 ire cut off—and you're got
 t selling your ability in com-
 ne with thousands of other
 the same fat.

AT assurance is yours that
 hen the "axe" falls, it will
 ou?

assurance is yours that if you
 iently thrown out of employ-
 ough no fault of yours—
 always get back in, at an at-
 salary?

sands of men—in every large
 America—are face to face
 at problem now.

n some the "axe" has already
 . They are trying as best they
 o sell their services, yet they
 themselves faced with the fact
 the market is flooded with men
 o can offer just as much as they.

Men Who Are Never Fired
—Steadily Promoted

or thousands of others, however,
 ne "axe" has not the slightest terror.
 Regardless of how drastically their
 employers chop the pay roll, they
 now they will steadily advance—
 ither with the companies they now
 e serving or with others which
 eed precisely what they have to offer.

For how can it be otherwise?

Suppose, for example, you could
 point to a cut of freight costs from

four per cent of gross sales to two
 per cent, on a sales volume running
 into the millions—as did W. H.
 Story, experienced, successful traffic
 manager for an Ohio corporation...

Or suppose you could point to
 some twenty-seven suggestions you
 had already made to your company,
 representing savings from \$20 to
 \$75 daily—as did J. R. Hollings-
 worth, in charge of a shift of men
 at one of the big factories in Akron...

Or suppose, as a trained salesman,
 you could increase the sales in your
 territory 50 per cent—as did I. A.
 Gould, Michigan district manager
 for the Smith Agricultural Chem-
 ical Company, Columbus, Ohio.

Or suppose that the balance sheet
 of your employer showed that—
 through your knowledge, as ac-
 countant, of the various factors that
 determine the success of a business
 enterprise—you had turned a loss

into a profit—as did E. W. Neir,
 manager of the Hotel Rowe, Grand
 Rapids.

Or suppose you could demon-
 strate specialized ability in Per-
 sonnel Management, say, or Busi-
 ness Correspondence, or any one
 of a dozen other attractive fields of
 business where good men are al-
 ways in demand and where proved
 ability quickly finds its reward in
 increased responsibility and in-
 creased pay.

How could any business man who
 was blessed with sense be persuaded
 to part with your services—when
 very clearly those services were show-
 ing him a handsome profit?

Can you afford to side-step so im-
 portant a matter any longer—when
 at home, without losing an hour
 from work or a dollar of pay, you
 can make your position sure, can
 steadily equip yourself for greater
 earning power?

The Secret of Success PREPAREDNESS!

On the coupon indicate the training
 that most clearly meets your need—
 fill in your name, address and present
 position, and place the coupon in
 the mail.

It will bring you—free—an at-
 tractive book clearly outlining the
 opportunities in the business field
 of your choice, together with a free
 copy of "Ten Years' Promotion in
 One," the book that has started
 thousands of men on the shorter
 path to a bigger income.

Do you mean what you say when
 you say that you want to get ahead?

Prove it by what you do with this
 coupon—NOW!

ARTISTS HAVE A BETTER CHANCE

"I was just one of the crowd for a long time until I got tired of being pushed around and decided to train my liking for drawing.

"Now, when so many untrained people are up against it, I'm glad every day that I studied art. With big business using art for everything from package designs to automobiles, there are opportunities for trained artists.

"It's a big satisfaction to know that I have my own style, and nobody else can draw exactly like I do. Of course, no art school can guarantee jobs, but it's certainly true that trained artists have a better chance to make good than untrained people in ordinary lines."

Investigate the Federal Course in Illustrating. More than fifty famous artists contribute their experience to this Course. Hundreds of students during the past fifteen years have bettered their income and position in life by learning Illustrating, Cartooning, Designing, Lettering, Show Card Writing at home through the Federal Course. Many are now earning \$2500 to \$6000 a year—some even more.

Free Vocational Art Test

Find out about your art ability. Fill in the coupon below and mail for Free Vocational Art Test today. The way to make money is to train your talent. Send for this Art Test.

TO THE CLASS OF '30

me. you started a career after finishing high school, you've had time to realize a few things now. You have discovered that your diploma not only opens the doors of a business or industry but instantly places you in a big job. You know how hard it is to get ahead with your limited education. You are face to face with the stern reality of making your way against trained men.

Think about you—those who are getting ahead without college degrees by circumstances. Many ambitious men today use high-school education as a beneficial background in acquiring the specialized training they need most. So can you!

International Correspondence Schools can do for you what it has done for them. All over the world high-school graduates are acquiring the practical knowledge they need from this 40-year-old institution. "Based on personal experience," says Jos. E. Driscoll of Roanoke, Va., "my advice to young men and women who cannot attend college is to take an I. C. S. course along

the line of work they wish to follow." Marking the coupon below may be far more important to your earning power than the day you received that high-school diploma. Think about this!

Challenge us to help you!

AGE RANGE 18 to 50

Step Out of That Low Pay No Future Job In 12 Weeks

Don't let another depression or added responsibilities or old age find you being kicked around from one job to another—never sure of a steady job and willing to work at any old price they want to pay you. Good times are coming soon but it's the trained man who will benefit.

Get Into **ELECTRICITY** My Amazingly Easy Way

Right now—Today—decide once and for all to get out of that small pay, hopeless job. Now—and forever—say good-bye to twenty-five and thirty-five dollars a week. Let me show you how to qualify for real money-making jobs **LEADING TO SALARIES OF FIFTY AND SIXTY DOLLARS A WEEK AND UP, in Electricity**—by an amazing way that makes you a **PRACTICAL TRAINED MAN IN 90 DAYS**. Getting into Electricity is far easier than you imagine.

Learn By Doing In 90 Days Right Here In the Great Coyne Shops

You don't need advanced education or any former electrical experience here at Coyne. I don't care if you don't know a generator from an airbrake—I don't expect you to! Mail the coupon today for my big Free Book. It tells you how I have taken thousands of fellows just like you out of small pay, man-killing jobs and made them happy and contented, in their new work—holding a better job today than they ever dreamed they would have.

Learn by Doing

I train you on real electrical machinery—not on special training machinery or toy equipment, but on exactly the same kind of machinery you will work on when you graduate from my school—hundreds of thousands of dollars' worth of equipment occupying over 50,000 square feet of our new sanitary fireproof building. You work on real dynamos, engines, power plants, autos, switchboards, transmitting stations—everything from doorbells to power plants—full sized—in operation every day.

Earn While You Learn

FREE EMPLOYMENT SERVICE FOR LIFE After You Graduate

If you are short of money, my Employment Department will give you every help in finding part time work to pay a part of your expenses. Write me if you would need this assistance. Then when you graduate they will give you lifetime employment service.

COYNE ELECTRICAL SCHOOL
H. C. Lewis, Pres. Founded 1899
500 S. Paulina Street Dept. 22-72 Chicago, Illinois

Prepare for Jobs Like These

Here are a few of hundreds of positions open to trained men. Our free employment bureau gives you lifetime employment service.
Armature Expert
Substation Operator
Auto Electrician
Inventor
Maintenance Engineer
Service Station Owner
Electric Refrigeration
Radio Expert
Construction Work

Our Student Service Department Handles All Your Problems

You have nothing to worry about. My student service department takes care of getting you in a good clean home where you will get room and board very reasonable. You will be among friends here at Coyne who will see that you are made comfortable and happy while you are with us. Good clean sports and entertainment are provided during hours when you are not attending school.

Electric Refrigeration

Right now I am including at no extra cost, my big new Electric Refrigeration course. Thousands of opportunities in this great new field. Mail coupon today for all the facts on my training, and how thousands have made good.

Men who work with their hands make the **BEST DRAFTSMEN**

..and we'll back them with this **AMAZING GUARANTEE**

We are looking for more ambitious young fellows with factory, building-trade or any other kind of mechanical experience to prepare for and help place in well-paid Drafting positions. Such men, we find, are unusually successful as Draftsmen, because they know how things are done, and that's a priceless asset to the man who makes the blueprint plans. Get in touch with us and we'll tell you how you can cash in on your entire past experience.

Drafting Is Logically Your Next Move!

Of course you realize the biggest handicap to mechanical work is that you're limited in earning capacity to the output of your two hands, as long as you live. Even the skilled mechanic earning \$30 to \$50 a week has reached his limit. He can never earn more and when he gets old he will earn **less**. So we don't blame any man for wanting to get away from this futureless outlook. For wanting to get into something where he can use his **head** as well as his hands—where he will be paid for what he **knows**, instead of only for what he **does**...

You know enough about blueprints to understand that PLANS govern every move in factory and construction jobs. The Draftsman who makes them is several jumps ahead of the workman who follows them. And so we want you to know that DRAFTING is a logical, natural PROMOTION from mechanical and building work—better-paid, more interesting—just the kind of work you'd enjoy doing.

THE AMERICAN SCHOOL
Dept. D-247, Drexel Ave. & 58th St.
CHICAGO, ILLINOIS

American School
of Drafting and Design

3 GUARANTEES

1. We will get you ready for a good Drafting Job at home, in your spare time.
2. Actual Drafting room practice, prepared by noted Engineers, Architects and Executives.
3. We will help you find a well-paid position as soon as you are ready for it.

We have placed machinists, patterners, masons, plumbers, railroad men, office clerks, farmers and even laborers in fine Drafting Jobs under this plan. Mail coupon for details of our remarkable offer.

GET OUR **NO-RISK PLAN**

The way to a fine Drafting job for you is easier than you think. It takes no "artistic talent" or advanced education. Thousands of men no smarter than you, with no more education or ability, have learned it quickly and you can, too. With the co-operation of some of the biggest employers and engineers in the U.S., we have worked out a plan to prepare you for Drafting work in your spare time at home—then to help you get a fine position when you're ready for it.

"I have landed a job with the Pacific Tel. and Tel. Co. in Seattle, and I must say that I am greatly indebted to the American School for my success. You have done all that you promised in helping me obtain employment."

T. C. White,
Seattle, Wash.

TEST LESSON **FREE**

...to prove you can learn at home in your spare time.

American School,
Dept. D-247, Drexel Ave. and 58th St., Chicago.

Broadcasting Stations offer fascinating jobs paying from \$1,000 to \$5,000 a year.

Police Departments are finding Radio a great aid in their work. Many good jobs have been made in this new field.

Spare time net working is paying N. H. J. men \$200 to \$1,000 a year. Full time men are making as much as \$50, \$75, \$100 a week.

Talking Movies—an invention made possible only by radio—offers many fine jobs to trained radio men paying \$10 to \$200 a week.

Television—the exciting field of many great opportunities—is created by my course.

You're Wanted

Take your pick of these fine **Big Pay** Radio Jobs

YOU have seen how the men and young men who got into the automobile, motion picture and other industries when they were started had the first chance at the key jobs—are now the \$5,000, \$10,000 and \$15,000 a year men. Radio offers you the same chance that made men rich in those businesses. Its growth has already made men independent and will make many more wealthy in the future. Its amazing growth can put you ahead too. Don't pass up this opportunity for a good job and future financial independence.

Many Fine \$50 to \$100 a Week Jobs Opening Every Year

Why slave your life away for \$25 to \$40 a week in a no-future job when you can get ready in a short time for Radio where the good jobs pay \$50, \$60, \$75 and \$100 a week? And many of these jobs can quickly lead to \$150 to \$200 a week. Many fine jobs are opening every year for men with the right training—the kind of training I'll give you.

I Am Doubling and Tripling Salaries

Where you find big growth you always find many big opportunities. I am doubling and tripling the salaries of many men every year. After training with me only a short time they are able to make \$1,000 to \$3,000 a year more than they were getting before. Figure out for yourself what an increase like this would mean to you—the many things that mean so much in happiness and comfort that you could buy with an additional \$1,000 to \$3,000 a year.

Many Make \$10 to \$25 a Week Extra Almost at Once

The day you start I'll show you how to do 28 jobs common in most every neighborhood that you can do in your spare time. I'll show you how to repair and service all makes of sets and do many other jobs all through my course. I'll give you the plans and ideas that are making \$200 to \$1,000 for my students while they are taking my course. G. W. Page, 2210 Eighth Ave. S., Nashville, Tennessee, writes: "I made \$935 in my spare time while taking your course."

You Have Many Jobs to Choose From

Broadcasting stations use engineers, operators, station managers. Radio manufacturers continuously need testers, inspectors, foremen, engineers, service men, buyers and managers. Shipping companies, police departments, commercial land stations, aircraft companies, offer good operators jobs from time to time. There are hundreds of opportunities for you to have a spare time or full time Radio business of your own. I'll show you how to start one with practically no capital. My book tells you of other opportunities. Be sure to get it at once.

\$400 a Month

"I spent fifteen years as traveling salesman and was making good money but could see the opportunities in Radio. Believe me I am not sorry, for I have made more money than ever before. I have made more than \$400 each month and it really was your course that brought me in this. I can't say too much for your school." J. G. Dohdsread, Radio Station KYA, San Francisco, Cal.

\$800 in Spare Time

"Money could not pay for what I got out of your course. I did not know a single thing about Radio before I enrolled but I have made \$800 in my spare time although my work keeps me away from home from 6:00 A. M. to 7:00 P. M. Every word I ever read about your course I have found true." Milton J. Leiby, Jr., Topton, Pennsylvania.

Seldom Under \$100 a Week

"My earnings in Radio are many times greater than I ever expected them to be. In November I made \$577, December \$645, January \$465. My earnings seldom fall under \$100 a week. I'll say the N. H. J. course is thorough and complete. You give a man more for his money than anybody else." E. E. Winborne, 1247 W. 48th St., Norfolk, Va.

When writing to advertisers please mention Popular Mechanics

for a **Big Pay** Radio Job

I will train you **AT HOME** free book gives facts and proof

I Will Train You at Home in Your Spare Time

Hold your job. There is no need for you to leave home. I will train you quickly and inexpensively during your spare time. You don't have to be a high school graduate. My course is written in a clear, interesting style that most anyone can grasp. I'll give you practical experience under my 50-50 method of training—one-half from lesson books and one-half from practical experiments. When you graduate you won't have to take any kind of a job to get experience—you will be trained and experienced ready to take a responsible job in the radio field of your choice.

Television and Talking Movies Included

My course not only gives you a thorough training in Radio—all you need to know to get and hold a good job—but also your choice, without extra charge, of any one of my special advanced courses: (1) Television, (2) Aircraft Radio, (3) Broadcasting, Commercial and Ship Radio Stations, (4) Sound Pictures and Public Address Systems, and (5) Advanced Radio Servicing and Merchandising. You won't be a "one job" man when you finish my course. You'll know how to handle a job in any one of Radio's 20 different branches of opportunity.

SPECIAL FREE OFFER

"THE PRINCIPLES OF TELEVISION"

For the first time this authoritative book on Television is made available to the general public. Until now only my students could have it. Act promptly, and I'll send you a copy FREE, in addition to my big free book "Rich Rewards in Radio." This book on Television gives you the fundamental facts about Television, its status, a comparison of sound and visual communication, and describes in detail the typical devices used in the six fundamental steps of Television. Get the facts about this coming field of great opportunity. Mail the coupon NOW.

ACT QUICKLY!

Lifetime Employment Service to All Graduates

When you finish my course you won't be turned loose to shift for yourself. Then is when I will step in to help you find a job through my Employment Department. This Employment Service is free of extra charge both to you and the employer.

Your Money Back If Not Satisfied

You do not risk a penny when you enroll with me. I will give you an agreement in writing, legal and binding upon the institute, to refund every penny of your money if, upon completing my course, you are not satisfied with my Lessons and Instruction Service. The resources of the N. R. I., Pioneer and Largest Home-Study Radio training organization, stands back of this agreement.

Find Out What Radio Offers You—Get My Book at Once

One copy of my valuable book, "Rich Rewards in Radio," is free to anyone interested in making more money. It tells you where the good jobs are, what they pay, how you can quickly and easily fit yourself to get one. The coupon below will bring you a copy. Send it at once. Your request does not obligate you in any way. Act NOW.

**J. E. SMITH, President
NATIONAL RADIO INSTITUTE**

Dept. 2BP

Washington, D. C.

I give You **8 Big Outfits** of Radio parts for *Extensive Practical Experiments*

You can build over 100 circuits with the outfits I give you. You learn from actual experience about A.C., Screen Grid circuits, push-pull amplification and the other features in modern sets. You work out with your hands the principles, diagrams and circuits you learn from my lesson books. You get as much practical experience under this unequaled method of home training, in a few months, as the average fellow gets in two to four years in the field.

Seven tube screen grid tuned radio frequency receiver—only one of many circuits you can build.

There is Security and Opportunity in DRAFTING

DRAFTING is one of the best professions a young man can choose because it pays good salaries and it is the stepping stone to even better positions. Many leading architects, mechanical engineers and electrical engineers put their start at the drafting board.

There is no easier way to learn Drafting than through the International Correspondence Schools. The practical value of these courses is shown by the success of I. C. S. students and also by the fact that employers are constantly writing us for trained men. We receive more calls for I. C. S. draftsmen than for graduates of any other course.

"Starting as a core boy in a foundry, advancing to moulder, patternmaker and machinist, I felt the need of special training and enrolled with the I. C. S. I am now employed in a responsible capacity in engineering development for U. S. Aluminum Company.

JAMES M. FOX, Chief Draftsman,
U. S. Aluminum Company, New Kensington, Pa."

There is no doubt that Drafting offers a real opportunity to ambitious men and it will pay you to investigate it. Just mark and mail the coupon and we'll gladly send you a booklet telling all about the I. C. S. courses in Drafting or any other subject in which you are interested.

INTERNATIONAL CORRESPONDENCE SCHOOLS "The Universal University"

Box 5585-G, Scranton, Penna.

Without cost or obligation, please send me a copy of your booklet, "Who Wins and Why," and full particulars about the subject before which I have marked X:

NORTH AMERICAN INSTITUTE, Dept. 1352
3801 Michigan Avenue, Chicago, Illinois

"I Saved Six Orders and Made \$90 in One Day. . . Thanks to This Pocket Volume!"

I'VE only been selling about a year. When I broke in, though I realized that trained salesmen are the highest paid men in the world, I expected the going to be hard at first. It was—a lot harder than I'd expected, even. At the end of six months I was commencing to get discouraged. I certainly hadn't made a flop of it—but I wasn't getting the results I should have had.

Naturally, seeing other fellows who started right with me go right ahead, I realized something was wrong. A particularly disheartening thing was the fact that at times I'd be right on the point of closing a good-sized order—and all of a sudden, it would go "flop." In fact, it kept happening all the time. I was doing something, I knew, that was killing those sales.

Finally I decided that I had to do something. I had been hearing a lot about National Salesmen's Training Association. But I'd never investigated them. Then, one day, I read one of their announcements. I was amazed to find how comprehensively they covered the training of salesmen. Furthermore, they announced that they were sending a most unusual volume, "The Key to Master Salesmanship," to ambitious men who asked for it—not only experienced salesmen, but men who had never sold, but wanted a chance in this highly paid field.

Naturally, I wrote for it—it seemed to me that here was the certain solution to the errors I had been making. Imagine my surprise—and interest—when there arrived, not only one book but two. To this day I can't decide which of those books helped me most. The little book which I had not been expecting was just what I needed at the time. It was written for men just like me—men who had been plugging along in salesmanship—never successful, never so hopeless that they quit selling. And while "The Key to Master Salesmanship" gave me an insight into the real secrets of salesmanship, the other book, "Mistakes Commonly Made in Selling," was the one I could first get practical use from.

Right in the first few pages, I saw some examples quoted. They were things I had been doing every day. I'd never dreamed they were dangerous errors. The more I thought about them, the more clear it became, though, why I was having such difficulty with my closes. I thought to myself: "By golly, that's why Barnes decided to put off buying, this very afternoon!" I kept on thinking of men whose orders I had lost, through just that very mistake. There were six of them.

The next morning I sallied out, bright and early to see if I couldn't save those sales, using the tips given me. Before noon, I had put the practical suggestions of that little book to work—and sure enough, in every case, I made the sale which I had thought was gone glimmering. Six sales saved—at \$15 commission apiece, that was \$90 made, by one morning's work, plus the advice of a little book that cost me nothing!

Of course, that set me to thinking. If that one piece of knowledge could make me \$90, how much would I make out of having all the knowledge which the National Salesmen's Training Association could give me? It didn't take long to figure that one out, either! I was enrolled for the full training that same

night; and the next two weeks saw my sales record soar. Not a minute of time lost—I studied just in spare hours but I learned things in those spare hours that I'd never have picked up, just by my own experience.

Today, I find amazing increase in the volume of my sales now over what they were a year ago. Then I was selling only about 40% of my quota—this month, with a quota twice as high as it used to be, I'm 50% over! And you know what quantity production means when the bonus checks roll around!

Today any man who wants to see how to end some of his biggest sales weaknesses can learn from this book some of the most frequent mistakes which spoil sales, and get practical suggestions how to end them. Not a penny of obligation—"Mistakes Commonly Made in Selling" is now FREE to any ambitious man. At the same time we

will send you, also free, the new and finer edition of "The Key to Master Salesmanship," which since its publication has been read by many men who have got into the biggest pay class of salesmanship. Write for both these valuable volumes now—the coupon will bring them by return mail.

NATIONAL SALESMEN'S TRAINING ASSOCIATION

Dept. B-104, 21 W. Elm St., Chicago, Ill.

A NEW AND FINER EDITION

Thousands who read the original edition of "The Key to Master Salesmanship" are men who today are among the leaders of successful selling. Today, in addition to "Mistakes Commonly Made in Selling," we are sending "The Key to Master Salesmanship," in its new and finer edition, the product of years of salesmanship research. FREE to salesmen. Real ambition, and a desire to make the most of salesmanship, are all you need to get this volume. Simply mail the coupon and it will be sent to you, with your own copy of "Mistakes Commonly Made in Selling."

National Salesmen's Training Association,

I haven't known a lonesome evening

... since I discovered this easy way of
TEACHING MYSELF how to play in my spare time!

IT'S all very well to read or even listen to the radio—for a while. But a fellow wants to be doing something—wants to meet people—have a good time. And why not? You're only young once.

Yet somehow I couldn't make friends. I'd be invited out occasionally but these occasions were few and far between. I must have been considered a wet blanket at parties. You see, all the other guests were able to do their share toward making things lively by entertaining in one way or another. But I was able to contribute nothing. . . . No wonder they didn't invite me often!

But that was before Bob took me in hand. Bob played the piano marvelously well—and I loved to listen to him.

One evening I commented on his ability to play. He turned to me and said: "Why don't you learn to play? In your spare time, I mean."

Bob's Method

I must have looked my astonishment, for he continued:

"I know lots of fellows who have learned to play the piano, saxophone, even violin, after work. Just a few minutes a day ate all that are necessary."

"What?" I exclaimed. "Why, I thought it took forever to learn to play. All those scales and exercises. . . . Besides, it's too expensive."

"Nonsense!" Bob laughed. "I'll tell you how I learned. You think I play pretty well, don't you?" I nodded. "Well, I taught myself to play. Right in this room. Without a teacher. And say, it didn't cost a fraction of what those old-fashioned, slow methods do!"

Then he told me all about the U. S. School of Music method. How the lessons come by mail. How there is no expensive private teacher to pay. How easy the lessons are. How you learn to play by note right from the start.

"Listen!" he continued. "I'll prove it to you. Send for one of their free demonstration lessons."

Fun—Popularity

I was amazed when the demonstration lesson came. Why, it was as easy as A-B-C! I sent for the piano course. Almost before I knew it, I was able to play real tunes and melodies. And the lessons were such fun!

But the best part came later. I was invited to fill in at a party. This time I didn't sit in a corner all evening. Instead, I took my place with the best of them—actually played two pieces, "Old Black Joe," and the ever popular "Hallelujah!"—that seemed to make an instant hit with the crowd. At any rate, I received an invitation for the very next week. . . .

From then on my playing has steadily improved, until now I can play anything my friends ask me to. Yes—I have plenty of friends now—thanks to my new found ability to entertain at the piano! Every minute of my spare time is now in demand—parties, entertainments, friends and fun. That's living!

* * * * *

This story is typical. The sooner you get started musically, the sooner you'll be popular. Decide now to learn to play

your favorite instrument the U. S. School way. Previous musical talent or knowledge is never required. We've proved that to over 600,000 people.

Whether you take up piano, violin, cello, or any other instrument, you'll find that every single thing you need to know is explained in detail. And the explanation is always practical. That's why students of this famous course get ahead twice as fast as those who study old-time, plodding methods.

Free Book and Demonstration Lesson

To prove how practical our course is, we will be glad to send you a typical demonstration lesson and explanatory booklet—without charge. The booklet will also tell you all about the amazing new Automatic Finger Control. Clip and mail the coupon NOW, before it's too late. No obligation. Instruments supplied when needed, cash or credit. High School Course in Two Years!

You Want to Earn Big Money!

And you will not be satisfied unless you earn steady promotion. But are you prepared for the job ahead of you? Do you measure up to the standard that insures success? For a more responsible position a fairly good education is necessary. To write a sensible business letter, to prepare estimates, to figure cost and to compute interest, you must have a certain amount of preparation. All this you must be able to do before you will earn promotion. Many business houses hire no men whose general knowledge is not equal to a high school course. Why? Because big business refuses to burden itself with men who are barred from promotion by the lack of elementary education.

Can You Qualify for a Better Position

We have a plan whereby you can. We can give you a complete but simplified high school course in two years, giving you all the essentials that form the foundation of practical business. It will prepare you to hold your own where competition is keen and exacting. Do not doubt your ability, but make up your mind to it and you will soon have the requirements that will bring you success and big money. **YOU CAN DO IT.**

Let us show you how to get on the road to success. It will not cost you a single working hour. Write today. It costs you nothing but a stamp.

YOU can be one of these Men!

Aircraft Draftsman
Salary, \$50 to
\$100 a week

Airport Managers
At \$100 to
\$150 a week

Airplane Salesmen
Make \$50 to \$100
a week and UP

Pilots
Earn \$1000 to
\$6000 a year

Aircraft Mechanics
Make \$50 to
\$100 a week

I'll show You how..

to earn \$50 to \$100 a week in Aviation!

YOU MEN who are sick of small pay and hard, grinding work—here's your chance! Edward Dick took my course and received an immediate offer of a fine job as Chief Mechanic and Assistant Manager. Paul Boehn connected with a big airplane manufacturer. Ira Bergen left his old job to become Chief Draftsman with an aeronautical concern in Brooklyn—And many more have turned their backs on low-paid drudgery to take *real jobs in Aviation.*

All You Need Is Ambition

If you've got red blood and an ounce of grit in your make-up, then you'll like the fascinating, active, adventuresome life that Aviation offers. I'll train you for it—right in your own home. Don't give up your job! Don't go to a strange city! Stay right where you are! I'll bring the whole Aviation industry to you. My course is written in easy, simple language—hundreds of photos and charts make everything clear. You don't need a high-school education; many of my most successful students never finished the grades—in Aviation you need *practical knowledge only!* I teach you practical facts

I Showed Mengel

"I am now working as a motor mechanic for the Wright Aeronautical Corp. I am sure that without the training your course gave me, it would be impossible for me to hold this job. The cash rewards go only to the men who use his head and learn the theory on which the machine is based." Warren Mengel, 1501 N. 14th St., Reading, Pa.

I Showed Money-penny

"I'm mighty glad I tied up with Hinton. Your organization has always been ready to help me in every way. Before actually completing your course I was able to obtain and hold the responsible position of chief engineer with the Allied Corp." C. H. Money-penny, Cedarville, Mich.

Walter Hinton

Former Navy flier, *first* to pilot a plane across the Atlantic (The NC-4). First to use an airplane in exploration work. Instructor of war-time fliers at Pensacola, Florida. His proven home study course, endorsed by prominent fliers and aircraft manufacturers, prepares you for a real future in Aviation—as a Field Superintendent, Airport Manager, Plane Mechanic, Engine Mechanic, Air Traffic Manager, Pilot, Engine Expert, Airplane Assemblyman—or in any one of forty other highly paid jobs on the ground or in the air.

about airplanes, engines, airports, mechanical details and shop kinks that you can use right on the job.

Employment Service FREE of Extra Cost

Just as soon as you are trained, my Nationwide Employment Department will help you find the job you want. This service comes to you absolutely FREE of any extra cost. It's getting results, getting real jobs, for other ambitious men, and can for YOU.

Save \$50 to \$450 on Your Flying Time

I've arranged with flying schools all over the country to give special discounts to graduates of my ground school. Often these discounts save you much more than the whole cost of my course! You get a discount check worth actual CASH as soon as you graduate.

Get the Facts—FREE

Send for my big book of facts about YOUR OPPORTUNITY in Aviation TODAY. It's free—you don't obligate yourself in any way. This book has been the turning point to success for many other fellows—it will show YOU, too, the way to *big success and big pay* in Aviation. Just mail that coupon NOW!

Says Good-bye to \$200 a Month

Now He Earns Better
Than \$10,000 a Year

At 45, C. J. Farris, of Memphis, Tenn., was earning \$200 a month as Credit Manager.

"For years," he writes, "I did general accounting work for a large corporation, doing the physical work without an understanding of the underlying principles, which caused me untold worry and a constant unsatisfied position in connection with my service."

"Finally, as a way out, I enrolled for LaSalle home-study training in Higher Accountancy, and with the daily study of principles, and the solving of practical problems in Higher Accountancy under specialized instruction, came a rapid broadening of ability—a new self-confidence that put to rout the elements of fear and indecision."

And how quickly his income mounted!

Within a year came a "raise" to \$3,000—one year later, a more responsible position commanding \$5,000 salary—then, with the winning of his degree as Certified Public Accountant, his entrance into a highly profitable profession, and the building of his own highly successful accounting firm.

Send for Free Book—

"Accountancy, the Profession that Pays"

"I wish I could cry from a mountain top to young men everywhere, 'Educate yourself—prepare—qualify—for tomorrow your opportunity may come.'"

So writes Mr. Farris—and well he may, for right in his own experience he has proved the tremendous power of home-study training as an aid to progress.

Are you ambitious to make a real success in business—to fit yourself for positions paying \$3,000, \$5,000, \$10,000 a year, and even better? You do not need a knowledge of book-keeping to make your start. LaSalle trains you from the ground up, according to your individual needs. Low cost; easy terms.

If you are dissatisfied with your present equipment, you will find LaSalle's 64-page book, "Accountancy, the Profession that Pays," of the greatest help and inspiration—and—LaSalle will send it to you FREE. For the sake of a brighter future, clip and mail the coupon NOW.

LEARN RADIO-TELEVISION TALKING PICTURES in LOS ANGELES

Come to sunny California where many of the world's most famous Radio Stars make their home—where the great Laboratories of the American Television Corporation are located—where hundreds of trained Sound Engineers and Mechanics are employed in the Talking Picture Studios and Theatres of Hollywood.

Railroad Fare Allowed to California

Don't worry about the expense of the trip! For a limited time we are allowing railroad fare to Los Angeles from any point in the United States. This is deducted from your tuition, so the trip costs you nothing extra. Take advantage of this opportunity to visit Los Angeles and Hollywood, and prepare for a good job at the same time.

PRACTICAL SHOP TRAINING

At the Oldest Trade School in the West

For over 25 years National has been training men by the practical shop method. Over 20,000 ambitious men from all over America have come to National for their training. You'll find National graduates working in the famous Studios of Hollywood, in Talking Picture Theatres, great Broadcasting Stations, for Radio Manufacturers and Dealers, while many have gone into the Radio business for themselves and are making big money as their own boss. What they have done, you can do!

MANY JOBS OPEN

10,000,000 Radio sets to be constantly serviced! 600 Broadcasting Stations employing trained Operators and Mechanics! 10,000 Theatres equipped for sound and the job only half done! Eight stations already sending out regular Television programs! New jobs will be opening up every day—hundreds of golden

NATIONAL TELEVISION, TALKING PICTURE and RADIO SCHOOL

Dept. 24-E

4006 SO. FIGUEROA ST., LOS ANGELES, CALIF.

opportunities for the trained man. And you can prepare for them in 4 months at National!

FREE EMPLOYMENT SERVICE Spare Time Jobs While at School

When you've finished National Training—four months of practical Shop Work in the great National Television, Talking Picture and Radio Shops,—then National's Employment Department will assist you in every possible way to get the job you want. And if you're short of money, National will gladly help you to get a spare time job to pay your living expenses while at school.

MAIL COUPON FOR BIG FREE BOOK

"The Boss Didn't Even Know My Name"

"He said my face was more or less familiar and he remembered seeing me around, but he didn't even know my name until the I. C. S. wrote him that George Jackson had enrolled for a course of home study and was doing fine work."

"Who's George Jackson?" he asked. Then he looked me up. Told me he was glad to see I was ambitious. Said he'd keep his eye on me."

"He did too. Gave me my chance when Frank Jordan was sent out on the road. I was promoted over older men who had been with the firm for years."

"My spare-time studying helped me to get that job and to keep it after I got it. It certainly was a lucky day for me when I signed that I. C. S. coupon."

How much longer are you going to wait before you take the step that will bring you advancement and more money?

It takes only a moment to mark and mail this coupon and send it to the International Correspondence Schools at Scranton, but that one simple little step may change your entire life. Isn't it better to do this today than to wait a year or five years and then wish you had?

Mail the Coupon for Free Booklet

1000 Hotel Positions Open!

Hotel, Restaurant, Club and Institutional field calling for trained men. Thousands of well-paid positions open annually. Nationwide opportunities for trained men to qualify as Manager, Assistant Manager, Steward, Room Clerk, Purchasing Agent, Sports Director and for many other important positions, paying from \$2,000 to \$7,500 a year, with living often included. Nearly one billion dollars' worth of new hotels, apartment hotels, clubs, restaurants and institutions being built will need almost 100,000 trained men and women.

TRAIN IN YOUR SPARE TIME AT HOME

Qualify in your spare time through our Personal Coaching Plan, which adapts the training to your needs. Hundreds

of graduates put in touch with positions. All over the United States, Lewis graduates are making good. Hotels start you at salaries up to \$2,500 a year. If you want a steady, permanent position, with quick advancement, fascinating work, good pay, fine living, luxurious surroundings—you can find it in the hotel field.

PREVIOUS EXPERIENCE PROVED UNNECESSARY

All of your training under the personal supervision of Clifford Lewis, former U. S. Government Hotel and Restaurant Expert, who was appointed Managing Consultant by over 300 hotels throughout the United States.

Through Lewis Training, Mr. Robert Michael was appointed Manager of a Pennsylvania hotel, although less than a year in the hotel field, and A. Nachtergaele, 5th, was made Steward of an Oregon hotel. Absolutely inexperienced in

U.S. GOVERNMENT JOBS

\$1260 to \$3400 a Year
PICK YOUR JOB
Men, Boys—18 to 50

These are steady positions. Strikes, poor business conditions, or politics will not affect them. Government employees get their pay for twelve full months every year.

\$1900 to \$2700 a Year

Railway Postal Clerks get \$1,900 the first year, being paid on the first and fifteenth of each month. \$79.17 each pay day. Their pay is quickly increased, the maximum being \$2,700 a year. \$112.50 each pay day.

Railway Postal Clerks

Spring Examinations Expected

Railway Postal Clerks, like all Government employees, have a yearly vacation of 15 working days (about 18 days). On runs, they usually work 3 days and have 3 days off duty or in the same proportion. During this off duty and vacation their pay continues just as though they were working. They travel on a pass when on business and see the country. When they grow old, they are retired with a pension. Many Spring examinations expected.

City Mail Carriers, Post Office Clerks

Clerks and Carriers now commence at \$1,700 a year and automatically increase \$100 a year to \$2,100 and \$2,300. They also have 15 days' paid vacation. City residence is unnecessary.

Customs and Immigrant Inspector

Salary \$2,100 to \$3,300. Men 21 to 45. Work connected with examining immigrants and merchandise entering the country from foreign ports.

Is Your Job Steady?

Compare these conditions with your present or past prospects. Position, salary, pleasure, security, no change in sight for PERMANENT employment. Frequently out of a position and the year's average salary very low. DO YOU GET \$1,900 EVERY YEAR? HAVE YOU ANY ASSURANCE THAT A FEW YEARS FROM NOW YOU WILL GET \$2,100 to \$2,700 a YEAR?

You Can Get Them

Experience is usually unnecessary and political influence is not permitted. Let us show you how.

Get Free List of Positions

Fill out the following coupon. Tear it off and mail it today—now, at once.

This investment of two cents for a postage stamp may result in your getting a government job.

FRANKLIN INSTITUTE, Dept. M137, Rochester, N. Y.

Rush to me entirely free of charge (1) a full description of the position checked below; (2) Free Copy of 32-page book, "How to Get a U. S. Government Job"; (3) A list of the U. S. Government Jobs now obtainable; (4) Tell me how to get a Government Job.

Push-Pull Pentode Power Output Tubes—Multi-Mu Screen Grid Tubes—Real Automatic Volume Control—All the Latest Improvements that Give Amazing New Clarity, Perfect Tone, Split-Hair Selectivity and Sensitivity Never Before Heard Of!

RADIO FANS! Just what you've been looking for! A powerful, new 11-tube radio at an unbelievably low price. And what a radio! Two Push-pull pentode power output tubes with twice the power and four times the sensitivity of ordinary 45's—and Multi-Mu tubes, together with a -24 first detector, gives you SIX SCREEN GRIDS. These six screen grids, together with the -27 oscillator, second detector, first A. F., and automatic volume control—the -80 tubes—gives a total of ELEVEN TUBES, with reception equal to fifteen ordinary tubes—in a perfectly balanced, non-oscillating, non-radiating, super-heterodyne TEN-TUNED circuit with real Automatic Volume Control that holds these powerful locals down to the same volume as distant stations and counteracts fading on weak stations. The use of a band-pass or pre-selector stage, together with Multi-Mu tubes, makes this radio actually surpass 10 K. C. selectivity. Absolutely eliminates those noisy singing "birdies" and annoying cross talks. You'll be positively amazed and delighted when you see this sensational new set, hear the beautiful mellow, cathedral tone—know what it means to have pin-dot selectivity and unequalled sensitivity.

Be convinced—TRY IT 30 DAYS BEFORE YOU BUY. Don't send a penny. Mail coupon right now for amazing FREE trial offer and complete details. You'll be surprised.

Mail this Coupon for Complete Details and Big FREE Catalog!

NOW FIX ANY MAKE OF AUTO

SIX BIG AUTO BOOKS ALL SHIPPED FREE

on approval; whether you want to qualify as garage owner, auto repair expert or merely wish to know how to keep your own car 100% efficient, look at these books—they are sent to you for free examination. This brand

new edition has been prepared by a large group of America's greatest automotive engineers. Anybody who can read will understand them, for this great automobile encyclopedia is a veritable gold mine of valuable facts. Take advantage of this great opportunity now; send in the coupon for FREE examination. You don't pay us a penny, you don't obligate yourself to pay anything unless you decide to keep the books. Just tell us you want to see them and the full set of 6 great volumes, just off the press, will be sent to you. Read them, look them over and prove to your own satisfaction that one fact alone, which you will find in them, may save you an expensive repair, or help you to a better job.

Aviation Motors

In addition to being a complete encyclopedia of automobile engineering, these books contain over 100 pages on Aviation Motors, and as they are just off the press they bring to you the latest and latest information obtainable. This alone makes these books invaluable to anyone.

Brand New Edition

Imagine books which are so new that every page is right up to date—wiring diagrams, construction details, service problems—are all right up to the minute. Nowhere else that we know of can you get an complete and up-to-date information. Over a million dollars of resources have enabled us to give you the most up-to-date books on the subject ever published. You will find nearly 20 pages on front wheel drive alone. Everybody interested in automobiles in any way will welcome these books, especially on our no money offer.

CAN YOU FIX IT?

Can you take out "play" in differentials? Can you kill the "shimmy" in steering? Can you reset TIMING? Can you put your finger on engine trouble without guessing or tinkering? Can you pull the starter off and fix it? Can you adjust and repair transmissions, axles, rear ends, bearings?

These Books Tell How

and tell you how to do any and every auto job right, the first time.

4 Big Volumes

Nearly 1,000 pages, over 1,000 illustrations, wiring diagrams, equipment charts, etc. The book edition with gold-stamped flexible binding. Best FREE for 10 days' use. If not wanted return express collect. If kept, send only \$2.00 after 10 days, then \$2.00 a month until special advertising price, \$24.00, is paid.

A Year's Consulting Membership FREE!

Privilege of consulting engineers of million-dollar American Technical Society on any automotive problem for one year without charge. If you wish coupon immediately.

SEND NO MONEY

American Technical Society, Dept. A-219,
Drexel Ave. at 58th St.,
Chicago, Illinois.

I would like to see the brand new 4-volume edition of your automobile books but without any obligation to buy. I will pay the few cents delivery charges only and will return the books and return them at your expense in 10 days unless I like them, in which case I will send you \$2.00 then and only \$2.00 per month until the special price of only \$24.00 is paid. You are to include free consulting membership certificate in the American Technical Society. Send brand new edition.

ABOUT RUPTURE

New MIRACLE WALL CLEANER

*Banishes Drudgery..
And Saves Costly
Redecorating!*

*The
New Way!*

Just out! The newest and most welcome household invention of the age! Nothing like it ever before. Cleans walls, ceilings like magic. Also window shades, upholstered furniture, felt hats, etc. Every home needs it—wants it. Mail coupon at once for liberal introductory sample offer.

**Revolutionary Invention Pays Agents
Everywhere UP TO \$90 A WEEK!**

ONCE again American genius has taken the country by storm—with a remarkable new kind of household device that every housewife has prayed for! It's an amazing housecleaning invention that cleans by a combination of suction and friction. No such simple, mechanical cleaner was ever heard of before. Not only walls and ceilings can be cleaned by merely passing this device across the surface but also such things as window shades, upholstered furniture, etc. Think what a welcome relief from the old hated cleaning drudgery this means to millions of American housewives! And think of the easy money that awaits smart agents who get in on the ground floor with this sensational new seller!

Big Money For You Everywhere

Experienced salespeople will see at once that this timely discovery has ALL the features that guarantee quick, steady profits, full or spare time, the year 'round. Where else can you find a product with such an unlimited market? Each territory is still virgin for the MIRACLE Wall Cleaner, all the cream waiting to be grabbed all quick. Can you imagine a woman sticking to old, hard, slow cleaning methods when she can now let this light, inexpensive invention do it for her like magic? Not after she sees the new Miracle Cleaner!

A Sales Monopoly in Your Own Business

There is nothing like the MIRACLE Cleaner. It gives you a monopoly

on profits because it cannot be bought in stores or elsewhere. Everyone you sell makes a friend who will tell others, bringing automatic repeat profits. No wonder that under actual selling tests men and women have easily made as much as \$8 and \$10 in a single hour with this discovery! Although the price is amazingly low, you make up to 170% profits on each sale. This means as high as \$15 and \$20 the very first day is waiting for you! But the important thing is to get in on the ground floor, if you want to make this kind of money. Find out the full facts. Learn how you can become the local representative for this red-hot seller and 47 other fast-selling Household Specialties needed in every home. Test a sample of this new MIRACLE Cleaner at our risk. Get your Sales Outfit entirely FREE. This is an opportunity in a million. The facts cost just a 2c stamp. So mail the coupon below QUICK . . . NOW!

"Seldom see an I.C.S. graduate OUT OF A JOB—"

"IN ALL the years I have known of the International Correspondence Schools, I have seldom seen one of your graduates out of a job."

A business executive made this statement in a recent letter commenting on the I. C. S. graduates and students in his employ and expressing regrets that it is necessary to reduce the personnel of his organization.

"However," he added, "all I. C. S. graduates and students will be retained, for I realize their value in the conduct of my business."

The reason I. C. S. men always have jobs is because they are *trained men*. You, too, can be an I. C. S. man. In this age of efficiency and specialization, to be an I. C. S. man means security for the present and assurance for the future.

Mark the subject in which you are most interested. Mail the coupon today. It has been the most important act in thousands of men's lives!

Using Tobacco

Perhaps you've tried to stop using tobacco only to find that the habit has such a hold on you that you gave up trying.

You know, better than anyone else, whether tobacco is hurting you, and if it is, that sooner or later, it will undermine your health. Heart trouble, indigestion, dyspepsia, nervousness, insomnia, poor eyesight—these and many other disorders can often be traced directly to the use of tobacco, according to good medical authority. Besides it is an expensive, utterly useless habit.

Let Us Help You To Banish The Habit

No matter how firm a grip tobacco has on you—no matter whether you've been smoking cigars, pipe or cigarettes or chewing plug or slice cut for a month or 50 years—Tobacco Redeemer will in most cases remove all craving for tobacco in any form in a very few days. It does its work so quickly that all tobacco "hunger" is gone almost before you know it. The desire for a smoke or chew usually begins to decrease after the very first dose.

Tobacco Redeemer contains no habit-forming drugs of any kind—it is in no sense a tobacco substitute. It does not cause the slightest shock to the nervous system; on the contrary, it often helps to quiet the nerves and make you feel better in every way.

SEND for PROOF

Get our free booklet. It tells you all about the deadly effects of tobacco and how easy it is now to quit. We will also send you copies of letters from confirmed users telling how this simple, home-treatment freed them absolutely from the habit. Just mail coupon—or a postal will do.

NEWELL PHARMACAL CO.

Dept. 999

St. Louis, Mo.

Send me without obligation to me in any way, proof that Tobacco Redeemer will positively free me from the Tobacco Habit or my money will be refunded.

YOU WANT TO EARN MORE MONEY—YOU WANT TO BE SURE OF STEADY EMPLOYMENT—YOU WANT TO BE CERTAIN OF YOUR FUTURE—HERE THEN IS THE OPPORTUNITY YOU HAVE WAITED FOR.

Start Now-Learn RADIO at Home

—and get into the world's fastest growing and best paying industry.

Here is a blazing message to real, red-blooded he-men.

"Broadcasting stations use engineers, operators, and maintenance men and pay \$40 to \$100 a week and up.

"Manufacturers and their jobbers and dealers employ thousands of men as engineers, foremen, inspectors, testers, service men, salesmen and managers and pay \$40 to \$150 and \$200 a week.

"Sound picture concerns and public address systems use engineers, installation and maintenance experts, etc., and pay \$40 to \$200 a week and up.

"Manufacturers of photo-electric cell equipment (Radio's electric eye) use designers, adaptation engineers, installation men and salesmen at salaries ranging from \$40 to \$200 a week and up.

"Steamship companies employ hundreds of Radio operators, give world-wide travel, at salaries of \$85 to \$200 a month and all expenses."

Why, then, slave away at \$20 or \$25 or \$30 a week on a back-breaking no-future job, when Radio offers you such wonderful opportunity for good pay and early advancement?

The Opportunity of a Lifetime

Never before in the history of American industry has such a chance been available to the average working man. And the opportunity is open to any normal, ambitious man—regardless of age, schooling or experience—to any man who is willing to spend an average of 30 minutes a day for a few months time, in learning the theory and practical application of all Radio devices, old and new.

You will be taught at home, in your spare time, easily and quickly, and your training will be under the actual supervision of a group of Radio's most prominent business men and engineers. Your training will be practical, too, and right up-to-the-minute.

TELEVISION
TALKING PICTURES
SOUND SYSTEM
PHOTO CELL WORK

Sixteen Manufacturers Endorse.

This course of home-training is unqualifiedly endorsed by sixteen of Radio's oldest, largest and most progressive manufacturers, among whom are—

Brunswick	Maenetic
Grosley	Sironberg-Carlson
Fada	and
Philco	Zenith

The constant and ever-increasing demand for trained men in this field has been brought about by the almost unheard of rapid growth of Radio and its sister industries—SOUND PICTURES, PUBLIC ADDRESS SYSTEMS, PHOTO-ELECTRIC CELL EQUIPMENT and TELEVISION.

Jobs—Exceptionally Good Pay—Big Future

Where only hundreds of men were employed a few years ago, thousands are employed today. Where a few years ago a

hundred jobs paid \$50 to \$75 a week, there are thousands of such jobs today. And there will be thousands more of such jobs for trained men in the next few years to come, because Radio is growing tremendously fast.

That's why this call for trained men.

That's why this chance for ambitious men to train at home, in their spare time, for this important work.

Badly as the Radio Industry itself needs these trained men, it has no time to train them. It is too busy with its more important problems of manufacture and distribution.

So the actual training of men for Radio's better-paying jobs has become the task of the Radio and Television Institute, of Chicago.

Men are being enrolled for this training NOW.

Now, Then

If you are interested in bettering your position—if you want to get out of a small-pay, no-future job, into good-pay, big-future work—fill in the coupon below and send it to us at once.

There will be no obligation. And it will certainly pay you to investigate.

FREE OPPORTUNITY BOOK COUPON

RADIO AND TELEVISION INSTITUTE,
Dept. 12, 2130 Lawrence Ave., Chicago.

Please send me a copy of your Opportunity Book and full particulars of your plan for helping men into good pay positions in the Radio field.

FREE Sample SAVASOLE

Amazing "Plastic Leather"
Invention Revolutionizes
Shoe Repairs!

Made \$135 in Week

I gave up my former connection where I ranged in earnings from \$315 to \$386 per month. I started out with three gross of Savasole. Since that time, my earnings have netted me over \$135 per week and I am sure that I will soon hit \$200 per week. Savasole has solved my financial problems, and you are the whitest bunch of people to work for I ever saw. G. C. Miller.

**Builds
up
Leather
or Rubber Heels**

I'll Help You Start

I give you unlimited cooperation. You can become my District Manager and have sub-agents of your own. And besides your liberal daily cash commissions, you can share big bonuses and extra awards! Only Savasole can use the genuine Bollman Double-action Cement process, on which patents have been applied for. And genuine perfected Savasole is guaranteed satisfactory. People order and re-order it for shoes, boots, harness, rubbers, cuts in auto tires—1001 uses. Beware of imitations.

THE PERFECT MANUFACTURING COMPANY
B-30 Daylight Bldg. Cincinnati, Ohio

BEFORE and AFTER Using Savasole

BEFORE—Here at the left is an old shoe worn down, ready to be sent to the shoemaker, who would charge \$1.00 to \$1.75 for stiff, unyielding leather soles and tacked-on heels—BUT the shoe was repaired for a few cents with SAVASOLE.

AFTER—Here at the right is the same shoe repaired with SAVASOLE. No hammer, nails or pegs. All the cracks and breaks are filled in and covered up with a hard, smooth, waterproof, non-slip surface. SAVASOLE repairs shoes for one-tenth shoe-maker's cost.

**See For Yourself How It Puts On
New Soles**
for as low as
Brings You \$42. Daily Profit!
as high as
9¢ A PAIR

Send No Money!

Mail Coupon for Free Sample on Leather

I am determined to put a FREE SAMPLE OF SAVASOLE in the hands of every man and woman who is ambitious to share in Savasole's success! I want you to test for yourself this amazing discovery of mine—without a penny of cost. See how Savasole builds smooth, waterproof, leatherlike new soles on any old shoes for as little as 9¢ a pair! You will then know why city workers, farmers, housewives, everybody snaps up this perfected product which is such a blessing in hard times—why you can make so much money. Just mail the coupon—send no money—get your FREE SAMPLE!

What SAVASOLE Is—What It Does

Savasole is a scientific "plastic leather" invention that does away forever with costly shoe repair bills. It puts new soles on old worn out shoes. It spreads on easily with an old knife and fills in all holes, cracks and

worn spots. Let it dry over night and in the morning you have a brand new sole that is smooth, thick and waterproof; that looks and wears like leather. Rebuilds run down heels, too, and is good for repairing 1001 other articles.

Exclusive Rights!

I'll show you how to start as my representative and immediately—without experience—earn money like G. C. Miller. Read his story above. He is only one of hundreds who are making real money with SAVASOLE. I expect a flood of answers to this offer. Somebody in your town is going to get my FREE SAMPLE—start taking those big cash profits—"see up" the exclusive selling rights! You can be that lucky representative if you act PROMPTLY. Clip, fill in and rush back the above coupon for your FREE SAMPLE and lifetime opportunity TODAY! Address me personally. R. R. Bollman, Pres.

Mail This Coupon Today!

The 97-Pound Weakling...

who became "The World's
Most Perfectly
Developed
Man"

**"I'll Prove to You in
7 Days that YOU, too,
Can be this NEW MAN!"**

—CHARLES ATLAS

WHEN I say I can make you over into a man of giant power and energy, I know what I'm talking about. I've seen my new system of body development, *Dynamic-Tension*, transform hundreds of weaker, punier men than you into Atlas Champions.

Take myself, for instance! I used to weigh only 97 pounds. I was a sickly scare-crow. Then I discovered *Dynamic-Tension*. It gave me a body that twice won me the title "The World's Most Perfectly Developed Man." It'll work just as big a change in you, too! I'm so sure of it that I make you this amazing offer: At my own risk I'll give you PROOF in just seven days that I can make you over into this NEW MAN. I'll begin training you on approval. If you don't notice a marvelous change in yourself within a week you don't owe me a cent.

No "ifs," "ands," or "maybes." Just tell me where you want handsome, steel-cable muscles. Are you fat and flabby? Or skinny and gawky? Are you short-winded, pepless? Do you hold back and let others walk off with the greatest girls, best jobs, etc.? Give me just 7 days! I'll PROVE to you that I can make you a healthy, confident, powerful **HE-MAN**.

Dynamic-Tension is an entirely NATURAL method. No mechanical apparatus to strain your heart and other vital organs. No pills, special foods, "trays" or other unnatural, artificial contraptions. Only a few minutes of your spare time daily is enough to show amazing results—and it's actually fun! *Dynamic-Tension* does the work.

Send for FREE BOOK

Mail the coupon right now for full details and I'll send you my illustrated book, "Everlasting Health and Strength." Tells all about my "Dynamic-Tension" method. Shows actual photos of men I've made into Atlas Champions. Supplies the facts you need to know about your condition. It's a valuable book! And it's FREE. Send for your copy today. Mail the coupon to me personally, CHARLES ATLAS, Dept. 8-P, 133 East 23rd Street, New York City.

NOTE:

No other Physical
Instructor in the
World has ever
DARED make
such an Offer!

CHARLES ATLAS
Dept. 8-P

133 East 23rd Street, New York City
I want the proof that your system of "Dynamic-Tension" will make a New Man of me—give me a healthy, husky body and big muscular development. Send me your free book, "Everlasting Health and Strength." This request places me under no obligation.

Let me help You get a GOVERNMENT POSITION!

NO special experience required to get one of these attractive Government positions. All you need is to pass an examination—and it is easy if you prepare for it. And that's my business. For eight years I was a Secretary Examiner. Since then, during the past twenty years, I have helped thousands into well-paid Government positions, and I can help you get there too. I know *how to train you* to get highest rating in Civil Service Examinations, which will qualify you for first positions open. You get the job you're after—or it costs you *nothing*.

Good Pay—Short Hours Steady Work

Get rid of the bugaboos of hard times, strikes, layoffs, job-hunting that you must always worry about in ordinary jobs. Don't stick in the low-pay jobs that start you off in a rut and keep you there. Work for Uncle Sam in a fine position you can't lose for any religious, political or personal reasons. Here's a wonderful position you can easily get that pays you from \$1850 to \$3300 a year; where there are no strikes or lock-outs, where you get vacations with pay, retirement pensions, 8-hour day, automatic yearly salary raises, unlimited opportunities for quick advancement, and many other advantages you can't get anywhere else!

Get my FREE Book

"How to Secure a Gov't Position"

If you are a citizen, eighteen to fifty, you can get the Civil Service Position you want. Write today for my new free book that tells all about the Civil Service—the jobs open, what you must do to get the job, the pay, the vacation, and all the big advantages of Government Positions. Find out just how I can help you land a steady good-paying position in the Civil Service in Washington, traveling, or near your home. Get ready NOW for the next Railway Postal Clerk Examination! Mail the coupon or a postal today.

A. R. PATTERSON, Civil Service Expert
PATTERSON SCHOOL
 82 Wisner Building, ROCHESTER, N. Y.

RAILWAY POSTAL CLERK

\$1850 to \$2700 a Year

Are you aging too soon . . . getting up 5 to 10 times at night . . . is vitality ebbing steadily away . . . are you definitely on the down grade, half-living, blue, depressed, subject to chronic constipation, chronic fatigue, backache, foot and leg pains? Then look to the vital prostate gland.

New Facts About the Prostate Gland

In men past 40, do you know that these symptoms are often the direct result of prostate gland failure? Are you aware that these symptoms frequently warn of the most critical period of a man's life, and that prostate trouble unchecked usually goes from bad to worse . . . that it frequently leads to years of fruitless treatment and even surgery . . . that it even threatens life itself?

FREE to Men Past 40

No man past 40 should go on blindly blaming old age for these distressing conditions. Know the true meaning of these symptoms. Send for a new, illustrated booklet, "The Destroyer of Male Health," written by a well-known American Scientist, and see if these facts apply to you.

There is little or nothing that medicine can do for the prostate gland. Massage is annoying, expensive and not always effective. Now this scientist has perfected a totally different kind of treatment that you can use in your own home. It employs no drugs, medicine, or violet rays. It stimulates the vital prostate gland in a new, natural way, and it is as harmless as brushing your hair. 100,000 men have used it with remarkable results.

Swift Natural Relief

Now physicians and surgeons in every part of the country are recommending this non-medical treatment. So directly does this new safe treatment go to the prostate gland that noticeable relief often follows overnight. So remarkable are the results that you can test it under a guarantee that unless you feel 10 years younger in 7 days you pay nothing.

Scientist's Book Free

Send now for this Scientist's free book and learn these new facts about the prostate gland and old age ailments.

I WISH I'D GONE TO VON HOFFMANN

No wonder the friends of Michael Corse say, "I wish I'd gone to Von Hoffmann." His letter speaks for itself:

"One week after I graduated from your Limited Commercial Pilot course, I found a position at McKinley Aero-Ways of Canton, Ohio, as a pilot. It was my first application for a job and I was accepted. I feel sure that the reputation of the Von Hoffmann Air College was responsible for my being placed in aviation so quickly. With such capable instructors, a student can't go wrong."

(Signed) MICHAEL CORSE

Write for Booklet No. 150, "What Aviation Offers You." If you are under 17, write for Preparatory Home Study Course.

SAMPLE LETTER

How Phillip Scott Found a \$1200.00 Secret in Popular Mechanics

"Some time ago I saw an article in Popular Mechanics which illustrated and fully described some grotesque figures carved out of hardwood that would crack nuts and be useful as well as ornamental. This clever idea appealed to me at once as a real money-maker and as a friend of mine, Phillip Scott, was out of work, I showed it to him. He read the simple instructions for making these unique dolls and became enthusiastic at once. He got busy making them and has since made over \$1200 in profits by selling them to folks for household use and for gift purposes. He gets lots of orders because he is the only one who makes these figures, and as a result today has money for things he could not otherwise afford. We're both grateful to Popular Mechanics for his sake." (He then states his reasons for thinking this is a good money-making idea.)—H. R. Pierce, Bookkeeper, Peoria, Illinois.

HOW would you like to win \$1,000.00 in real cash—just for writing a few words? This wonderful first prize and fifty-four other big cash awards totaling \$2,500.00 are waiting for readers of Popular Mechanics, in one of the most unique liberal cash prize contests ever conducted.

For many years, Popular Mechanics has been read regularly by thousands upon thousands of thinking men and women in every walk of life. Everyone has found this fascinating magazine a treasure chest of world-wide facts and money-making ideas. A steady parade of strange developments and scientific facts, gathered by our staff of 4346 correspondents from every corner of the globe, has enabled scores of wide-awake folks to turn their time into money.

No doubt you have seen many ideas in Popular Mechanics which struck you as being real money-makers. If so, you can win a big cash prize now by simply writing a short letter of 500 words or less, telling about some idea that you have found in any issue of Popular Mechanics. This may be an idea that you have seen or used yourself or simply an idea that you consider good enough to be used by somebody else.

That's all you have to do to win the \$1,000.00 first prize or one of the many other fine cash awards. What an easy way to win a nice bundle of cash to do with as you please! Remember, you have as good a chance to win as anybody. So follow the simple rules below and mail your letter before the contest ends.

Simple Rules

1. In 500 words or less, tell about some money-making idea that you have seen in any issue of Popular Mechanics which you have used to make money or which you feel could be used by someone else for profit, and give your reason.
2. Write on one side of the paper only, either typewriter, pen and ink, or pencil.
3. Literary style and grammar will not be considered. Selections will be based on ideas and the reasons for your choice.
4. Send in as many letters as you please. Replies must be post-

marked not later than midnight, February 10, 1932.

5. Anyone can enter this contest except employees of Popular Mechanics Magazine or members of their families.

6. Five judges will decide the winners and their decisions will be considered final.

7. Your name, complete address and your occupation must be plainly given at the end of your letter.

8. All answers to this contest must be addressed to Editor, Contest Number One.

Nothing to Buy or Sell . . . Now or Ever

When writing to advertisers please mention Popular Mechanics

Cash Prizes

...110 BIG CASH AWARDS IN ALL

Contest No 2 \$2500.00

**Popular Mechanics Offers
\$2500.00 For Practical
Money-Making Ideas
(Contest Ends February 10, 1932)**

THIS contest is entirely different and separate from Contest No. 1, which is described on the opposite page. Its purpose is to reward thinking folks who send in practical money-making ideas suitable for publication in Popular Mechanics Magazine. Fifty-five big cash prizes, totaling another \$2,500.00, will be given away for the best letters—in addition to the fifty-five cash prizes offered in Contest No. 1.

Think of it! All you have to do to win a handsome cash prize in this unusual contest is to send in a short letter of 500 words or less presenting your money-making idea. It may be an idea that is already helping you or some friend of yours to make extra money. It could be something to do at home, such as canning fruits and preserves or renting rooms to tourists, or it might be something like killing animal pests for bounty.

No matter how small your idea seems to be to you, do not hesitate sending it in at once. It is the simple, practical suggestion that is likely to win the first prize of \$1,000.00. You can enter one or both of these contests and send in as many letters as you wish. Literary style or grammar is not a factor. Awards will be based on the ideas and reasons submitted. So get busy at once and send in your letters. You may be \$1,000.00 richer by next spring if you do!

Simple Rules

1. In a letter of 500 words or less, state briefly your money-making suggestion. Your idea may be something that you or someone you know is already making money with. Or it may merely be a plan that you believe anyone can use to advantage for profit in full time or spare time.
2. Write on one side of paper only.
3. Literary style and grammar not considered. Selections based only on merits of ideas and reasons submitted.
4. Send in as many letters as you wish. Replies must be postmarked not later than midnight, February 10, 1932.
5. You can enter either or both of these contests. (Anyone is eligible to compete except employees of Popular Mechanics or members of their families.)
6. Winners of prizes in Contest No. 1 are eligible for prizes in Contest No. 2 but no one can win more than one prize in each contest.
7. Five judges will decide the winners and their decisions will be considered final.
8. Your name, complete address and your occupation must be plainly given at the bottom of your letter.
9. Replies to this contest must be addressed to Editor, Contest Number Two.

SAMPLE LETTER

**How "House-to-House"
Gardening Brings Kolo
\$35 to \$40 a Week**

"Early this spring, I was laid off at the garage," writes Walter F. Kolo. "Rather than sit around idle, I decided to fix up my back yard which I had never had time to give attention to. Soon I had a beautiful lawn and lovely flowers shooting up. One day while I was sprinkling my garden, my next door neighbor, an old widower who was in ill health, offered me \$25 to fix up his garden and \$5 a week to take care of it after that. You bet I grabbed his offer. That gave me the idea to go after other neighbors and friends who either didn't have the time or weren't physically able to do this work. My plan worked out so well that now I make as high as \$45 a week and enjoy the work very much more than at the garage." He then states his reason why he thinks this idea a good one for publication in a magazine like Popular Mechanics: Walter F. Kolo, Mechanic, Brooklyn, N. Y.

"I had to make more money—for her"

"THREE weeks after I met Ann we were engaged. It was when we began talking about rents and furniture and such things that I woke up.

"I'd been drifting along in a routine office job for years. I knew I didn't deserve a raise. And yet I had to make more money—a lot of it—and quick. It was Ann herself who suggested the International Correspondence Schools. She believed in me so thoroughly that she made me believe in myself, and I started studying the I. C. S. course in Accounting in my spare time.

"That was a year and a half ago. We've been married six months and I just got my third promotion. I'm head of the cost accounting department now. My I. C. S. course was the finest investment I ever made."

Are you one of the thousands of young men who need a bigger salary and a better job? In an hour a day of your spare time you can secure the training that will bring you advancement. Without cost, without obligation, find out what the I. C. S. can do for you. Mark and mail this coupon now!

Amazing New Automatic SUPER-JUICER

Banishes Another
Hateful Kitchen
Task Forever!..

*Oranges, Lemons,
Small Grape Fruits
Juice Themselves*

**LIKE
MAGIC**

AGENTS

Just Turn Crank And Make Up To

\$17 IN A DAY!

"**W**HY doesn't somebody invent a simple, inexpensive device that will automatically juice fruits without waste, work, mess, worry or bother?" For years, housewives in every nook and corner of America have hurled this challenge at manufacturers and agents. But the millions who daily enjoy these health-giving drinks have had to content with makeshift gadgets and squeezers. Now, into this vast ready-made market, comes just the remarkable new scientific marvel that women have prayed for—to bring them new kitchen freedom and to enable them and their families to thrive on citrus fruits. As a result, every ambitious man and woman now has an opportunity for full and spare time earnings positively unparalleled in the entire field of Direct Selling!

This revolutionary SUPER-JUICER is utterly different! Man, you can't possibly realize what wonders it performs until you actually thrill to its magic! Picture a simple, light and attractive little device that hangs on the wall. That does not have to be clamped or fastened to tables every time used. Imagine getting all of the juice out of oranges, lemons, small grapefruits, etc.—

just by turning a crank! Even a child can operate it. Patented stainless holds back seeds, pulp and pith. Amazingly easy to clean. No parts to rust. Durable—guaranteed for 5 years! And priced unbelievably low to sell on sight! Is it any wonder, then, that women grab it on sight and that Speedo people everywhere easily enjoy steady earnings up to \$5 and \$7 in an hour just meeting the nation-wide demand for this timely development?

DANGEROUS DIMMING ENDED..

== Road Light Doubled! ==

Crowds swarm about new invention at Auto Shows and I. A. F. N. how science has at last banished motorist's worst and greatest problem. Read details below.

AMAZING INVENTION

FITS ANY HEADLIGHT...

Revolutionizes Night Driving!

At last! Night driving suddenly becomes actually SAFER than day! At one sweep, a tiny, inexpensive invention banishes glare yet doubles road illumination! Cuts through every light on the road! Fits any car. Use coupon **QUICK** for liberal **FREE TEST OFFER!**

IT is a well-known fact that motor car manufacturers have solved every big problem except one. As soon as the sun goes down at night, the highways of America break forth into a constant, rushing stream of "dimming and dimming." Speed is cut down one-third to one-half. Every Monday morning finds the highways littered with broken glass, wrecks, cars in the ditch, overturned, shattered against telephone posts. Every man who ever groped dizzily down the highway in traffic at night knows the horrible sensation of being half-blinded by cars on his left, unable to see the ditch on his right, his own lights seeming dim and shadowy and practically worthless. Now, in a twinkling, this curse of night driving is lifted completely and inexpensively from the shoulders of the entire motoring world!

FITS ANY HEADLIGHT

This new lighting discovery is called Perfect-O-Lite. It is a little invention that replaces the "bulbs" in your automobile headlights. No extra wiring or installation. Yet actually DOES double road illumination. Handles used for Glass Shields. Cuts through the other fellow's light, yet absolutely cannot glare in his eyes. Makes rats, animals, children, danger signs, etc., visible at least three times as far. Makes night driving at 40 to 60 miles an hour safe and easy.

The secret of this new light is in the kind of "beam" or "ray" that it throws. Instead of ordinary light, this new invention throws a solid beam of double-reflected or "infused" light down the entire roadway. Shows up ditches at the side, as well as distant ob-

jects, absolutely clear, without the usual flickering "shadows." Space here limits further discussion of the facts.

MAKE YOUR OWN TEST FREE

Under an introductory offer you are now invited to be the judge and jury without risking one penny. The coupon brings full details of the invention, offer of a set of **FREE TEST** and facts about agent's money-making opportunities. Mail the coupon without obligation. **TODAY!**

AGENTS! Davis Made \$2,400 in 1 Week

This new invention unquestionably opens up one of the most amazing money-making opportunities ever presented. Here actually is that chance for \$8 to \$14 in your FIRST hour, \$8,000 to \$10,000 YEARLY, with no limit **WHATSOEVER** for Distributors! Fleet owners buy quantities. Wallace & Tiernan, N. J., trucks just equipped. Other big orders flooding in. A real self-advertiser; each car equipped is seen by thousands. Davis, Pa., made \$1,400 in one week. Start full-time or spare-time. Use coupon for **FREE TEST OFFER** and details of Exclusive Territory, etc.

HACHMEISTER-LIND CO.

Dept. B-30

Pittsburgh, Pa.

Perfect-O-Lite even looks absolutely unique and entirely different. Every sale brings dozens more. It's the greatest "self-advertiser" ever known.

Lights entire roadway, including ditch. Absolutely no glare to on-coming car. Unique double-reflected, "infused" light beam cuts through every light on the road. No flickering "shadows." Even lights distant objects with daylight clearness.

Throws all light on roadway. Shoots through fog, mist, rain and snow like magic!

Hachmeister-Lind Co., Dept. B-30, Pittsburgh, Pa.

—HERE'S REAL NEWS!—

Home Assembled HEATH Aircraft Now Eligible for Federal License

THE new Heath Model LN is granted Dept. of Commerce Approved Type Certificate 456. This makes Heath the lowest priced Approved Type plane in America—the plane that brought back the light plane world's altitude record from France.

But even more important, Heath has arranged with the Dept. of Commerce for LN models assembled at home to be eligible for "NC" Licenses. This makes it possible to gain the economy and performance Heath has always provided, with Dept. of Commerce approval.

Write today, enclosing 15c, for full information on this remarkable step forward, so typical of

Heath Leadership! Learn how you can assemble the splendid new Heath LN at home and have it eligible for license by the Dept. of Commerce. Learn how little it costs to fly the Heath way—and what an outstanding airplane this altitude record model is for you.

NEW TOO! EASY TERMS

Heath Aircraft may be assembled at home, or purchased ready to fly, one-third down, balance on notes. Heath has pioneered light aircraft for 22 years. Heath has won in its class at National Air Races for years. Heath is the answer to popular inexpensive flying.

Write today for full information.

51 MILES ON A GALLON of GASOLINE WINS ECONOMY CONTEST

49 MILES Takes 2nd Place Winning Cars Equipped With WHIRLWIND GAS SAVERS

Automobile owners who have been worrying about gasoline expense will be interested in an amazing test recently conducted by a Texas Motor Car Company. Twenty-three cars were entered in a mileage economy test, the winning car running 51 miles on a gallon of gas, the second car 49 miles on a gallon. When official test records were published it was found the two winning cars were both equipped with Whirlwind gas savers.

"Peak" Contest Mileages

The amazing results obtained in this mileage contest are naturally greater than those obtained in ordinary driving. Careful throttling, most economical speeds—no traffic hold-ups—and no waste of power thru quick stops, help to bring about these "peak" mileages.

A Test On Your Car

More power, faster pick-up, less carbon, quicker starting, and increased mileage is what users say in telling of their experience with the Whirlwind. Every motorist owes it to himself to test the Whirlwind to prove the results on his own car.

FITS ALL CARS

In just a few minutes the Whirlwind can be installed on any make of car, truck or tractor. It's actually less work than changing your oil or putting water in the battery. No drilling, tapping or changes of any kind necessary. It is guaranteed to work perfectly on any make of car, truck or tractor, large or small, new model or old model. The more you drive the more you save.

GUARANTEE

No matter what kind of a car you have or how big a gas eater it is the Whirlwind will save you money. While we do not claim to produce 49 to 51 miles on ordinary driving, we do guarantee that the Whirlwind will save its cost within 30 days or the trial will cost you nothing. We invite you to test it at our risk. You are to be the sole judge.

FREE OFFER COUPON

WHIRLWIND MANUFACTURING CO.,

☐ Check here if you are interested in full or part time salesman position.

How Whirlwinds Save Gasoline

The principle of the Whirlwind is to slightly compress the partly vaporized gasoline as it passes thru the raised venturi. Extra air enters from four air inlets at such a tangent as to pick up the unvaporized gasoline particles, whirling them into action.

The turbulence created breaks them into a vaporized gas, giving better, smoother power, quicker starting, cutting gasoline waste and carbon formation.

Car owners all over the world are amazed at the results of their tests. "I have more speed, power, and increased mileage," writes Henry Bomberger. "Hills I used to take in second I now make in high." Anton Wetsch: "I wouldn't take the Whirlwind off my car for any money. I am certainly convinced." W. B. Fountain: "My mileage has increased greatly. My car has plenty of pick-up and starts like a whip."

SALESMEN AND DISTRIBUTORS WANTED To Make Up To \$100 A Week and More

Whirlwind men are making big profits taking care of local business for this fast selling device that car owners cannot afford to be without. Good territory is still open. Free sample offer to workers. Full particulars sent on request. Just check the coupon.

Drawing Depicting How It Is Proposed to Recover the Treasure from the Wrecked "Lusitania" by Utilizing an Ocean "Stairway" Leading from Surface to Sea Floor

Popular Mechanics Magazine

REGISTERED IN U. S. PATENT OFFICE

WRITTEN SO YOU CAN UNDERSTAND IT

Vol. 57

FEBRUARY, 1932

No. 2

92370

LUSITANIA TREASURE *to be* RAISED

N.Y. Times 11/21/31

Budget report. Conn.
DOWN a steel-incased stairway inside a 200-foot tube, deep-sea divers expect to descend soon to the wreck of the historic "Lusitania," sunk in 240 feet of water eight miles off the Irish coast, in 1915, by a German submarine. From the end of this ocean stair, the divers propose to step onto the decks of the ill-fated liner and, with the aid of powerful submarine searchlights, will search every foot of the vessel, salvaging all articles of historic and intrinsic value, including the purser's safe and its contents.

The salvaging expedition is under the direction of Simon Lake, maker of submarines and inventor of the tube that is to be used, which was tested recently in the English channel. By employing this

Above, Top of "Stairway" Leading Down into Atlantic; Below, Lowering Powerful Submarine Lights

tube, Mr. Lake asserts the venture has been made as simple as "going down in an elevator" and less hazardous and difficult than other salvaging operations that have been carried out successfully.

A specially constructed trawler and a

*Lake. Oakley Lusitania
Is Reducing.*

launch will be used as bases of operations. The tube is five feet in diameter, but the observation room at its end, eight feet wide and twelve feet long, has a number of windows and will accommodate several persons at one time. This tube is to be placed on the upper deck of the "Lusitania," which, it has been found, is standing almost upright on the ocean floor, the tops of its stacks being only 175 feet beneath the surface.

Those entering the tube will walk down the stairs under normal atmospheric pressure until they enter the divers' operating chamber, outside of which will be various motor-operated winches and two doors providing exits for the divers. Before these doors can be opened, a pressure of air must be admitted into the chamber equal to the water pressure outside, about eighty-five pounds per square inch at that depth, and it is impossible to open the doors until pressure is equalized. The doors move downward, and no water can enter since the air flows outward from the compartment. With the aid of powerful searchlights, which likewise withstand a pressure of eighty-five pounds or more, the divers will explore

179

the vessel, spectators watching them from the observation room, as it is expected vision will be possible for from forty to sixty feet. One of the main advantages of the tube will be that divers can start to work fresh because, in deep-sea work, much of their time under water is spent in descending and ascending. As articles of historic or intrinsic value are uncovered, they will be raised by a derrick.

One of the first tasks, when the ship is reached, will be the taking of a complete photographic record of the wreck, from both the inside and outside of the vessel, employing the powerful lights to provide illumination. An electrical camera is to be used for this work, and if pictures are obtained, they will be the only ones ever taken at so great a depth under water.

Powerful Microscope Which Magnifies 5,000 Diameters and Brings Tiniest Bacteria to View

EXPANDING RACK FOR YOUR CAR FITS ON LUGGAGE CARRIER

Carrying facility for every size and kind of package or luggage is supplied the motorist who often wonders how he is to secure all his boxes and odd luggage to his auto, by a rack that fits any standard luggage carrier. The "form-a-rack," as the

device is called, can be readily adjusted to any four-sided shape and is quickly and easily attached. Six individual standards clamp to the trunk rack and have five slots for three or more heavy web straps. When not in use, the rack may be rolled up and carried in the tool compartment.

Black enamel finish
nickel \$10.00

MOST POWERFUL LENS BARES NEW INVISIBLE WORLDS

Hitherto invisible bacteria have been brought to view by a recently invented microscope more than twice as powerful as any that have been used previously. New fields of scientific research, particularly in bacteriology, are opened by this instrument by which bacteria have been magnified 5,000 diameters in tests. Dr. Royal Raymond Rife, its inventor, be-

lieves he may be able to magnify objects to 17,000 times their natural diameter. Heretofore the greatest power obtained by glasses has been about 2,500. Six quartz lenses are used in the microscope, and another unusual feature is that the object viewed, instead of being seen in reverse focus as with present instruments, is observed in its true perspective. It is expected that the glass will enable scientists to study bacteria so tiny that they pass readily through a stone filter.

OIL BURNER TO FIT ANY HEATER HAS GRAVITY FEED

Economical operation of any furnace or heater is made possible by an oil burner which has a gravity feed, eliminating special machinery, gas, electrical or mechanical parts. This oil burner, now on the market, uses distillate, the cheapest of fuels, or furnace oil. Fed to the burner by gravity, the oil is mixed with air to produce a gas for the flame. Any overflow is prevented by means of a safety valve which operates automatically.

Safety on Water Is Provided for Children by This Metal Air Tank, Shaped and Rigged Like a Boat

SAFE PLAYBOAT FOR CHILDREN IS AIR TANK OF METAL

Shaped to boat design with a seat in the center for passengers, an air tank of metal has been fashioned into a safe playboat for children. The craft is equipped with a removable mast, sails, rudder, paddle and a life line. Adults may use the boat for planing behind a motor craft. Galvanized iron is used in its construction.

COST OF WELDED-STEEL HOME ABOUT SAME AS WOOD

Figures showing the comparative cost of a home with a welded steel frame and one with a wood frame indicate that the steel house is now within reach of the pocketbook of the ordinary builder. The Iron League of Chicago recently compiled statistics to show that a brick-veneered welded-steel-frame house built in Cleve-

land cost only twenty-four dollars more than a frame house of the same type with brick-veneer walls. With quantity production, it is predicted that welded-steel fireproof construction will be much cheaper than building with wooden frames. The steel home on which figures were kept was a three-story, nine-room structure with built-in garage, the cost being \$12,532 as compared with \$12,508 for frame construction. About ten tons of steel were used in the frame, the material being delivered cut to length only, all fabrication being done at the site by one welder and two structural iron workers who put up three tons of steel the first day. For the steel home, the cost of the metal was \$881 as compared with \$180 for steel for the frame structure, but this was offset by savings in carpenter labor, rough lumber and masonry, cement and stone work.

LIQUID ADHESIVE FOR BANDAGE IS EASY TO APPLY

Bandages can be fastened quickly and securely with a liquid adhesive that dries instantly, and is as easily removed as applied. Instead of unrolling and cutting adhesive tape to the right size and shape, a little of the liquid is squeezed from a tube onto the bandage, the fastener being particularly convenient for flat areas where the bandage cannot be wound around the injured part. The adhesive resists oil, water or gasoline, but easily dissolves in chloroform or acetone.

SUPER-SPEED TUBE FOR X-RAY PHOTOGRAPHS HIDDEN ILLS

X-ray pictures snapped in one-thousandth of a second by a new tube are expected to reveal in the human body the beginnings of disease hitherto blurred or hidden by motion. This development in X-ray tubes is based on the discovery of a method of damming up the electric current like water behind an obstruction, and then letting the dam burst, the electricity rushing into the tube and snapping the picture at high speed. Three electrodes are used instead of the usual two, so that two can be combined into a sort of dam, behind which the electric charge is built up. When the charge is released, one electrode is changed from negative to positive, releasing the current into the tube. It is the invention of two scientists of the Westinghouse Lamp company.

ICE SKATE THAT FITS ANY SHOE HAS TOE LACES AND STRAP

Equipped with toe laces and a heel strap, the latest ice skate will fit any shoe. The fastening arrangement is more secure than clamps, and as strong as the riveted-toe shoe skate. Ordinary shoes or oxfords

may be worn. To put on the skate, the shoe is inserted so that the toe leathers can be laced tightly and tied. Then the heel strap is fastened with its tongueless buckle. There are

no metal working parts to rust and no clamp keys to lose in connection with this form of attachment.

RUBBER FROG LURES FISH

Since frogs are a natural food for most game fish, bait resembling live frogs is now being offered. This lure is made of a composition of cork, rubber fabric and other materials. In size, shape, coloring and action the frogs are lifelike, and the white underside makes them tempting and effective lures for night fishing. They can be used without becoming entangled among weeds and are made in three sizes.

STEEL BACKSTOP FOR BULLETS AIDS INDOOR PRACTICE

Indoor practice with rifle or pistol is made safe by a steel backstop for bullets. The backstop has a curved back plate which deflects the bullet downward into the bullet box, while a projecting lip on the bottom plate prevents ricochet and back spatter. A bullet cannot return to the mouth of the target box, and wear on the deflecting plate is negligible, due to the curve construction.

RAZOR BLADES REMOVE SLEET FROM AUTO WINDSHIELD

Sleet and ice can be cleared from the windshield of the car by two safety-razor blades which fit in an attachment easily fastened to any windshield wiper. The blades are set at an angle so that the motion of the wiper causes them to cut away snow and sleet with each move across the glass.

The BATTLE of the

Start of the 500-Mile Race at Indianapolis in 1931; Left, Louis Schneider, Winning Driver, and His Mechanic, Jigger Johnson

By THOMAS E. STIMSON, JR.

AFTER several years of retirement, the giants of the motor-car industry are preparing to fight it out again this year in the world's outdoor laboratory of automobile perfection—the Indianapolis speedway.

Early racing by the manufacturers did

much to test materials and improve designs. But eventually the glamour of the track diminished and the factories became too busy to pay much attention to brute speed.

Now, however, keen competition in the industry and startling new design features, brought out in the last year or so, have resulted in the makers

again turning their attention to racing, and several plants are constructing speed creations in secret for the 1932 grind.

"You are really driving a racing car yourself," explains Harry Miller, famous designer. "Today's automobiles are actually the racing cars of a few years ago, modified to suit your special needs. When you take the wheel of a new car, you are

GIANTS

Four-Wheel-Drive Racers on the Way

Above, Modern Racing Car with Modified Streamlining: Right, Charts Showing Piston Displacements for Indianapolis Races and Average Speeds of the Winners

driving the same sort of machine that was raced by Tommy Milton, Peter de Paolo, Billy Arnold, and other well-known drivers."

From three to six years usually elapse before an improvement in racing design is adapted to pleasure cars. The new developments must first prove their worth by helping win races. Then they must receive other thorough tests and perhaps be redesigned to allow volume production.

"Practically every feature of your car was first developed for the racing cars," says Mr. Miller. "For instance, your tires are racing tires. A few years ago, the tire factories had to build special racing brands for the track because the treads would fly off the regular type at high speed. Since then, nearly all tires have been improved up to racing requirements and only one factory is now making a special racing tread.

"Back in 1914 we had the Santa Monica road races. The course was over city streets and had several right-angle turns. So we built a car with four-wheel

hydraulic brakes to allow the driver to make speed right up to the corners. The automobile industry made the brakes prac-

was too high. By developing a better design and using a water pump, we were able to reduce radiators to a fraction of their former area. Water pumps then began to appear on the stock cars.

"Modern steering came in the same way. Racing drivers found it difficult to make their turns accurately at high speed. The present types were finally developed for them, and now steering

Top, Chain-Drive Racer of 1907; Center, Front-Wheel Drive of 1924-25; Below, Types of Pistons

tical from a production standpoint about the year 1924.

"Another instance is the front-wheel drive. The first efficient car of this type raced at Indianapolis in 1925. Four years later, front-wheel-drive cars were on the market. Again, multiple carburetors were developed for racing cars in 1916. They were adapted for pleasure cars around 1925.

"Before the war, racing cars had huge radiators which proved very inefficient. Streamlining was impossible with them, and the center of gravity for the whole car

is almost effortless. The small wheel sizes that are used today on every car were adopted first by racers, because they made steering easier. Present racing cars have even smaller wheels.

"Take the different metals that are used for a car. The early bronze bearings were good enough for pleasure cars, but they 'froze' up at high speed. So we turned to babbitt. Suspension springs formerly were made of soft steel, but so many breakages occurred that we tried the alloys. The same with valve springs.

"Crankshafts used to snap on the track, so European steel was imported. These steels were so much better that the entire industry demanded them, with the result that the best steels are now made in this country. Before the war, I wanted to try the effect of light-weight pistons in a racing engine, and obtained the aluminum in Germany. Aluminum pistons were so much better for racing that they are in general use today."

At his shop in Los Angeles, Mr. Miller has designed and built nearly 100 racing

Above, Single-Seat Racer; Right, Sixteen-Cylinder Racing Engine; Center, Piston Used in Racer; Bottom, Harry Miller Planning Racing Car

much power as, or more than, their predecessors. Racing designers turn the additional power into speed alone, but pleasure-car designers must break the power down into economy and faster pickup as well as speed. Small light engines, mounted in a racing chassis, require less power to

cars. Seven of the last ten winners at the annual Indianapolis classic were built by him.

Speed is not a matter of horsepower alone, Mr. Miller explained. The secret of speed is to develop power from as little weight as possible. Science has enabled the designers to build lighter, smaller engines every year, which produce as

he moved and can be streamlined more effectively.

What about the cars that we will be driving a few years from now? This question was put to Mr. Miller. For the answer, he referred to the racing cars of today.

"I don't mean that every feature of a modern racing car will be adopted by the factories," he said, "but some

Top, Assembling Chassis of Racer with Individually Sprung Wheels; Below, Front-Wheel Drive Mechanism of Racer

of the latest developments will be found practical for pleasure cars. For instance, many of the fast cars at Indianapolis have individually sprung wheels. This means that, when a wheel hits an obstacle or a hole, the jar is absorbed by the wheel and its special spring, and the car does not tilt. Undoubtedly this refinement will soon be found on some stock cars.

"The chief difference between today's racing cars and today's pleasure cars is the difference in compression. Racing engines use compression ratios as high as twelve to one. That is, the combustion chambers are so small that the fuel charge is compressed to one-twelfth of its original volume before it is ignited. Such engines get much more power from the same amount of fuel than do pleasure-car

engines that use six-to-one ratios. But the compression of pleasure-car engines is being increased every year. The high-compression racing engines require specially treated fuels that are not yet available in such concentrated mixtures to pleasure-car drivers."

At least one of the Miller specials at the 1932 Indianapolis race will be a four-wheel-drive car, a combination front and rear-wheel drive with a hydraulic clutch. This is the very latest development in racing design,

and if it proves to be more efficient than the present drives, it may be incorporated in stock automobiles within a few years.

JOINTLESS HOMES TO BE BUILT BY GERMAN ARCHITECTS

Jointless houses are planned by German architects who have called on chemists to produce a plastic wall putty. Every joint in the floor is an accumulator of dirt. Every joint in a wall, wallboard or wainscoting is a danger point for the strength and durability of the construction. So future buildings must be jointless, say the architects. On the other hand, as joints are safety valves for stresses of expansion and contraction due to changing temperatures, materials and putty must be elastic.

RADIO FADING MAY BE STOPPED BY CHARTING EARTH'S AIR

Radio fading may be prevented by adjusting signals to correspond with the varying heights of the Kennelly-Heaviside layer of air which hangs over the earth like a blanket. A device for measuring the height of this layer from the earth has been developed by the United States bureau of standards, and an experimental chart or map is being prepared. It has been found that the air blanket, which lies about 100 miles above the earth, billows up and down like a circus tent in a gale. Radio waves strike this blanket and "bounce" back to the earth at varying angles, depending on the height of the layer, and, as a result, the waves are not always correctly synchronized with other waves which travel along the ground, and fading occurs. Constant operation of the measuring device will show how the Heaviside layer is shifting upward or downward, thus enabling broadcast stations to regulate their transmitters accordingly in order to provide better reception. Television is expected to benefit especially.

Drafting Equipment Requiring No T-Square or Tacks and Has Scale Built In

BOARD WITHOUT A T-SQUARE MAKES DRAFTING EASIER

Simplicity is the feature of a new drafting board that requires no T-square or thumbtacks. For the drafting room, the instrument is provided in the form of a board with an adjustable straightedge to hold one or more sheets of paper. For rapid sketching, a "block" can be purchased which will hold a renewable block of paper. Instead of a T-square and the usual series of triangles, all that is necessary to draw all vertical and horizontal lines is the square provided with the outfit and a specially designed forty-five-sixty-seventy-five-degree triangle for all angles at intervals of fifteen degrees. The paper clamps in the apparatus.

SAW HARDER THAN SAPPHIRES CUTS TREATED WOODS

Saws with hard alloy teeth are necessary for cutting woods treated with fire-resisting or preserving chemicals. Such a saw is now on the market, which has a cutting edge composed of tungsten, carbon and cobalt, an alloy which is hard enough to scratch sapphire. The hottest flame known, that of hydrogen, is necessary in manufacturing this cutting edge, which retains its sharpness at bright red heat, since it has no temper to be drawn. The abrasive properties of treated woods do not dull these teeth.

SELF-ADJUSTING BENCH CLAMP LOCKS BOARDS UPRIGHT

Boards of any thickness up to two inches may be locked upright and rigid by a self-adjusting bench clamp now on the market. Planing is easy, since the board cannot slip back. The locking device is automatic, and the clamp will not mar or mark the board surface.

Boards Are Locked Upright with a Clamp That Fastens on the Workbench

coal fields found in the northern hemisphere to-day may represent relics of a flourishing equatorial vegetation dating from the time when these continents lay in the region of the equator. The scientists believe the north pole must have been somewhere in the region of the Pacific ocean with the British isles near the equator. There is also evidence that the continents once were all joined but split up and slid relatively to one another and to the poles.

PEEPSHOW MOVIE TURNED BY HAND CRANK

SHOWCARDS PRINTED BY HAND ON FAST, SIMPLE PRESS

Showcard printing by hand can be done speedily and economically by a press now on the market. The equipment, which has been adopted by many business houses, can be operated by a person without previous knowledge of printing. Several fonts of showcard type come with the press.

CONTINENTS SHIFT IN LATITUDE WITH COOLING OF EARTH

Continents of this world, over a period of millions of years, probably slid up and down the scale of latitude in a continual shift of positions. This is the belief of two scientists of the Royal Geographical Society of Great Britain who have evolved mathematical and geological formulæ as a basis for the theory. In simple tests, the scientists conceive that in a cooling world in which land masses first began to appear, the shrinking of the thin skin above the internal fires causes the newly formed and still semifluid land areas to move from the equator north and south according to the laws of centrifugal force. Evidence has been found that India once lay far south of its present location, for there are signs that its southern part once was covered with a heavy shroud of ice. The

Moving pictures for the individual are provided by a modern combination of the stereoscope and peepshow. After the film is inserted into a guide by means of pressure on a plate below the eyepiece, the rubber cup of the latter is placed to either eye, the hand crank turned and the show is on. The speed of the picture is controlled by the crank. Special film is produced for the machine.

What is Man's Greatest Invention?

LINCOLN'S

"LOST" SPEECH

Gives Answer

WHAT invention do you think has had the greatest effect on modern civilization?

Some say the wheel, because without it present-day transportation would be impossible and there would be no lathes, dynamos or engines. But the Mayas developed a high degree of civilization without it.

H. G. Wells says it was the "taboo," or the social customs and restraints which mark the difference between civilization and a dog kennel and without which it would be impossible for people to live together in peace and harmony.

Abraham Lincoln, who was an inventor

Self-Lifting Steamboat. Invented by Abraham Lincoln. Model of Which Is Preserved in the National Museum; the Boat Had Buoyancy Chambers to Lift It over River Obstructions; the Model Was Whittled from Cigar Boxes

before he was president, gave another answer in a "lost" speech, the original manuscript of which is now in the possession of Oliver R. Barrett, of Chicago.

The great invention of the world is writing, the art of communicating thoughts to the mind through the eye, Mr. Lincoln declared in this lecture on "Inventions and Discoveries." "When we remember that words are merely sounds, we shall conclude that the idea of representing these sounds by marks, so that whoever

creatures who have no considerable additional means of communicating thoughts.

"When man was possessed of speech alone, the chances of invention, discovery and improve-

Top, Lincoln Wagon, and, Right, Diagrammatic View Showing Wheel Action, Much the Same Principle as the Steering Knuckle on Modern Auto; Ancient Printing Press, Below

ment were very limited. When writing was invented, any important observation likely to lead to a discovery had at least a chance of being written down, and consequently a little chance of never being forgotten. By this means, the observation of a single individual might lead to an important invention years, and even centuries, after he was dead. In one word, by means of writing the seeds of invention were more permanently preserved and more widely sown. And yet for three thousand years, during which printing remained undiscovered

should at any time after see the marks would understand what sounds they meant, was a bold and ingenious conception.

"The thought of dividing sounds into parts, and making a mark, not to represent a whole sound, but only a part of one, and then combining those marks so as to represent thousands of words, was somehow conceived and pushed into practice. This was the invention of phonetic writing, as distinguished from clumsy picture writing. Take this invention from us, and the Bible, all history, all science, all government, all commerce, and nearly all social intercourse go with it.

"Speech alone, valuable as it ever has been and is, has not advanced the condition of the world much. This is abundantly evident when we look at the degraded condition of all those tribes of human

after writing was in use, it was only a small portion of the people who could write, or read writing; and consequently the field of invention, though much extended, still continued very limited. At length printing came, and consequently thousands of minds were brought into the field where there was but one before. Discoveries, inventions and improvements followed rapidly, and have been increasing their rapidity ever since."

Declaring that Young America's horror is directed, in the main, against anything that is old, particularly "Old Fogy," Mr. Lincoln said that "the great difference between Young America and Old Fogy is the result of discoveries, inventions, and improvements. These, in turn, are the result of observation, reflection, and experiment."

Mr. Wayne J. Alwell a 2319

prof. of anatomy

'SYNTHETIC' FROGS AID SCIENCE IN GLAND STUDY

San Diego 11/27/31

Frogs which are slightly synthetic are being grown at the University of Buffalo where they are being used in studying the functions of the ductless glands. These frogs are altered in the tadpole stage when their pituitary glands are transplanted from the normal location at the base of the brain to other positions. Changes result, some of which are striking and visible, while others are internal, but all are scientifically important and of potential value to man. The pituitary heads the series of ductless glands which are intimately associated with growth, personal appearance, disease, insanity and, indirectly, probably with the emotions. The pituitary is difficult to study, however, for its system of control is complex, but transplanting cuts off some of its functions so that those remaining stand out more clearly. The gland that is transplanted is about the size of a pin-head. When grafted into the tadpole's tail it cannot change into a frog, but if moved to a position near the inner ear, the wiggler becomes a frog although the frog turns a silvery color instead of green, due probably to atrophy of one of the sections of the pituitary. If the frog is given extracts of a part of the gland taken from other frogs, it then turns green, but when the extract is discontinued, it reverts to silver.

Wm. D. Ford
Reflecting Telescope at Ohio Wesleyan. Showing the Welded Steel Tube; Its Mirror Is Sixty-Nine Inches in Diameter

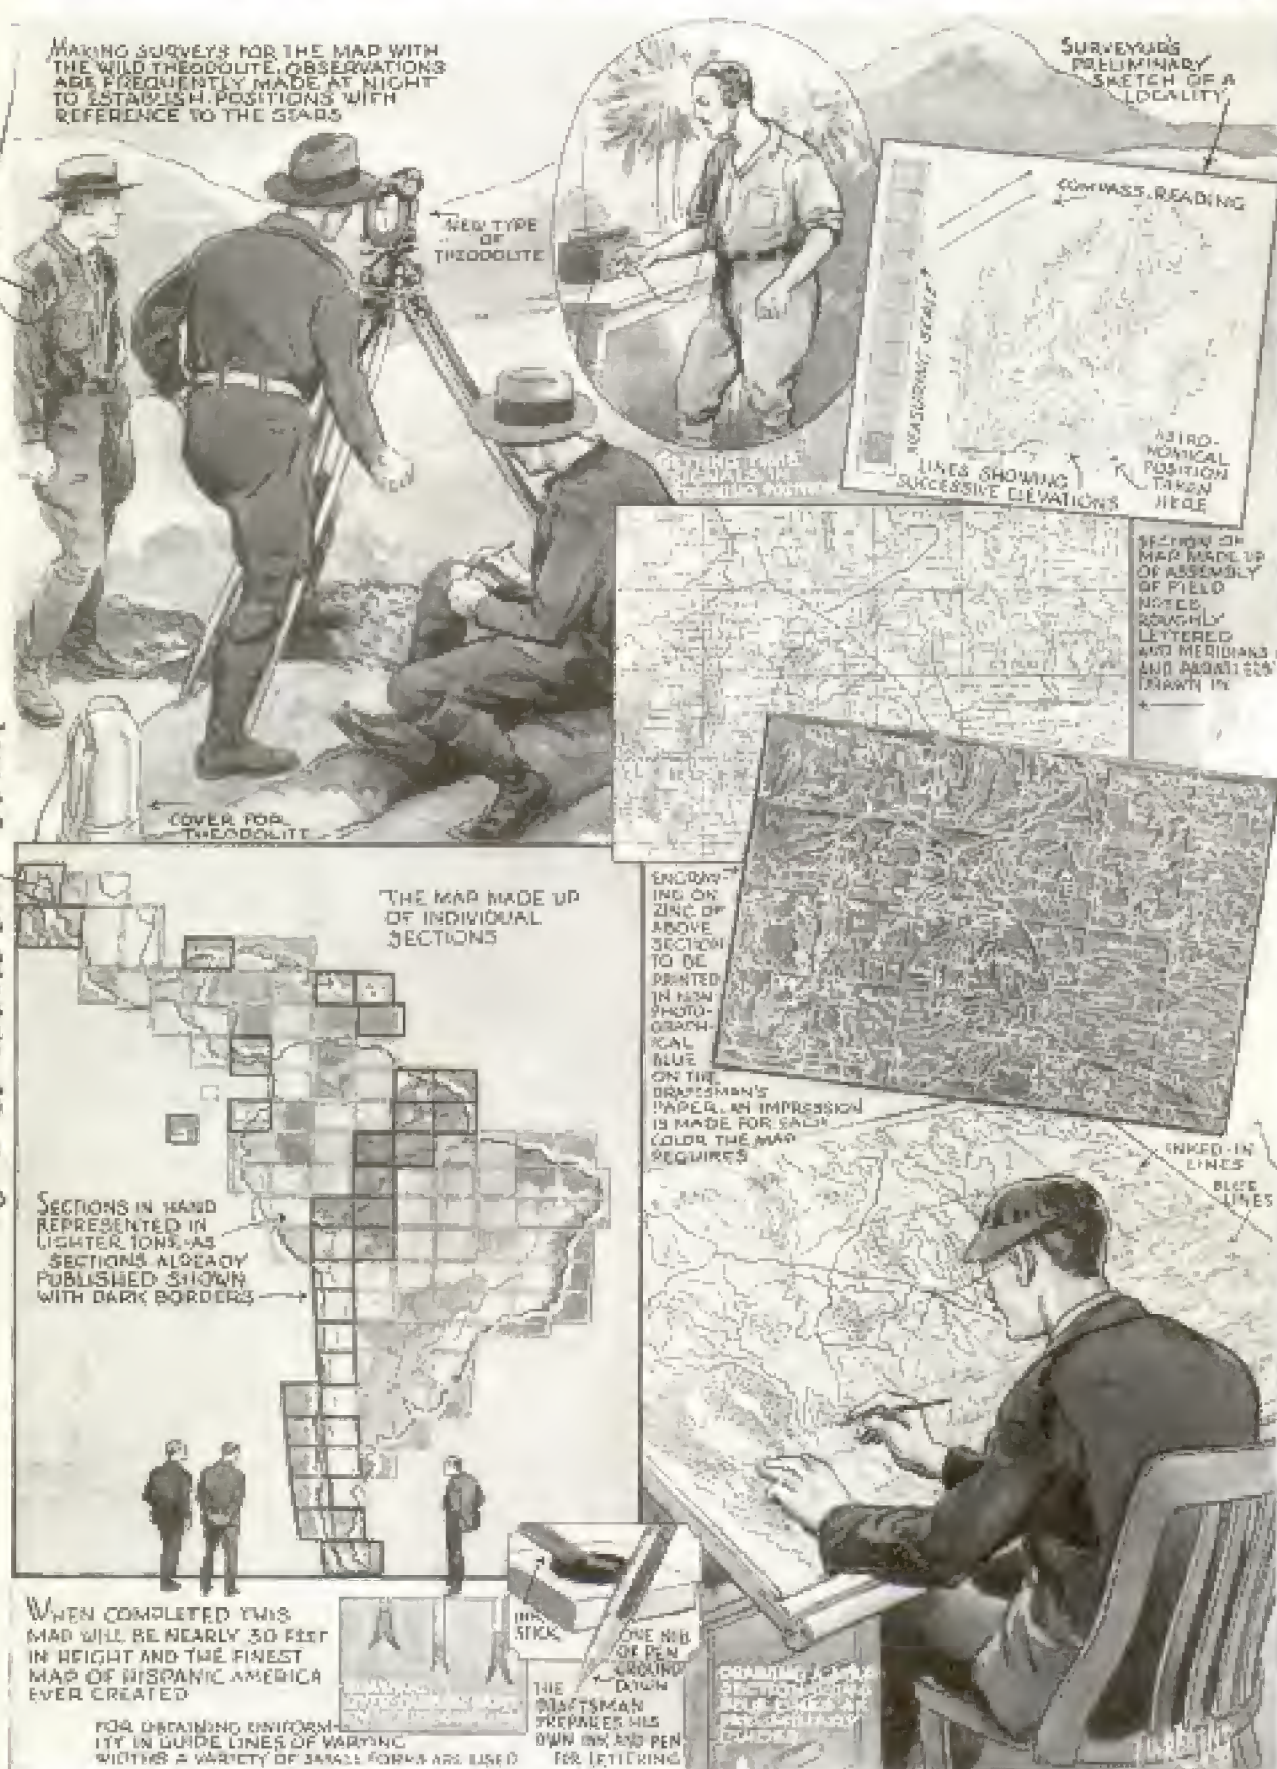

TELESCOPE HAS GIANT MIRROR TO REFLECT THE HEAVENS

While it is not the largest, the recently completed reflecting telescope housed in Perkins observatory at Ohio Wesleyan University possesses many unusual features, including the first tube to be made of electrically welded structural steel. Its mirror is sixty-nine inches in diameter and was made from the largest piece of optical glass ever manufactured in this country. The mirror weighs 3,790 pounds and the tube 17,000 pounds. The telescope also contains an electric clock which keeps the instrument steadily focused on that part of the sky which is under observation. Through it astronomers are able to view stars 120,000 times fainter than the faintest ones visible to the naked eye.

U. S. SURVEY OF GRASSHOPPERS
TO AID FIGHT IN SUMMER

First steps to avoid another outbreak of grasshoppers in the west and northwest next summer have been taken by the U. S. bureau of entomology. A survey, completed in December, was made to estimate the size of the 1932 grasshopper crop so that authorities and individuals could lay in supplies for the chemical warfare against the pests. Ordinarily, baits of arsenic-poisoned bran are distributed where the insects crawl the thickest, before they get their wings. The mild winter of 1930-31 caused a great abundance of hoppers, and local authorities neglected to take adequate steps to stop them, so that crops in many states were ruined.

ELECTRIC ALARM REMINDS YOU
TO KEEP APPOINTMENTS

An electric alarm clock now being offered not only gets the family up on time in the morning, but regulates household tasks and appointments throughout the day. This time clock is set to alarm at the usual rising hour, then needs neither rewinding nor resetting, for it is simply shut off each morning and rings again at the same time the succeeding morning. By an adjustable dial at the base, it can be regulated to ring at the expiration of any period of time from one minute to three hours. In this capacity, it reminds the owner of appointments, and also tells when eggs are boiled, or baby's feeding time arrives, or when a favorite radio program is due.

hours. In this capacity, it reminds the owner of appointments, and also tells when eggs are boiled, or baby's feeding time arrives, or when a favorite radio program is due.

OARLESS ROWBOAT OPERATED
WITH PADDLE AND CRANK

Oars for propelling one type of rowboat are displaced by a paddle at the stern which is operated by a handle. Turning the crank causes the paddle to turn in a continuous figure-eight movement, and by

Oarless Rowboat with Propeller in Form of a Paddle
Turned with a Crank

stopping the handle in any position and swinging it in the opposite direction the boat is backed. Steering is accomplished by a quick stroke on the handle with a slow return on either side as desired. The oarless boat not only liberates one hand of the operator entirely, but enables him to propel the craft with much less effort than by the usual rowing method.

SADDLES FOR WINDOW CORDS
REDUCE WEAR AND NOISE

Saddles of kiln-dried and oil-treated wood are being advocated by many builders and architects in the place of pulleys for window-sash cords. There are no flanges to cut or bind the cord. The saddles are noiseless, having no metal parts to squeak or rust, require no servicing, are said to be easier to weather-strip, and installation is simple. All that is necessary is to bore a hole the size of the saddle, insert it and secure it with a nail.

The TRUTH

metal walls, while a half-dozen trainers, with quick words and stinging whips, direct lions, leopards and tigers—some of them jungle-born animals not long accustomed to the commands of man—in their bits of action preparatory to shooting jungle scenes in the heart of Los Angeles.

Singly, then in pairs and threes, the lions are prodded from their cages. They dash down between the lines of trainers to open gates ahead. After three or four rehearsals, camera crews enter the steel camera cages, actors return through the

A

COMMAND barks out as a whip-lash darts between iron bars on the hind quarters of an African lion. Through the open door and down a long chute, the lion dashes out into a clearing in the jungle. Two lines of men, armed with whips and sticks, shout orders as the animal runs quickly across and enters a second chute, to disappear in the heavy growth of shrubs and trees.

In rehearsal, the problem is simple. Actors remain safely outside the 200-foot jungle protected by thirty-foot wood and

Top, a Lion That Took a Fancy to a Photographer; Below, Slicking Up a Tiger for the Movies

large swinging gates at the end, and the business of filming wild animals commences.

A director calls for action to start. Eleven cameras are trained on the clearing. The director raises his hand, lowers it. The gates click open and again the

about **WILD** **A**NIMALS

in the **M**OVIES

shouts, "Get up and get out," boom among the trees. Here come three magnificent beasts, once kings of the African open spaces. They approach the cameras, leap lightly across the clearing and disappear beyond. This scene passes without incident. Next the director calls for a lion to dash out from his cage, leap to a spot directly in front of the cameras and within ten feet of an actor, then pause, roar and retreat to the cage.

After the lion has been prodded and forced to leap into the jungle clearing, a trainer meets him halfway. The trainer steps forward, raises the whip, advances menacingly toward the on-rushing animal and shouts, "Ho!" The beast stops directly in front of the cameras, shakes his shaggy head and growls. Then he hears, seventy-five feet away, the click of the lock as his cage was opened. Knowing this to be a ha-

Wrestling with a Lion and Tickling It to Make It Roar; Below, an Elephant Actor Snatching a Man from the Ground.

ven of safety, the lion turns suddenly and retraces his steps, thus developing an apparent attack and retreat which the director sought.

The fear that these beasts may turn suddenly on some actor never leaves the trainers. In every close-up, a trainer stands almost within arm's reach of the actor, with a safety cage, into which the actor can jump, immediately at hand. And when a leopard poises on the shoulders of some actor, the trainer stands just outside camera range, "cuing" it either by voice or by shaking and pointing a whip. Some animal pictures are filmed in sound, others with silent cameras. In the latter case,

the growls and snarls are "dubbed" in later by a sound expert at the studio.

"Some animals," the trainer explained, "will act for the camera, others hate every lens they see. 'Jackie,' a lion; 'Gertie,' a jaguar; and 'Nissa' and 'Eckie,' leopards, work nicely for close-ups. These are filmed in sound, for they react quickly to silent cues. When training 'Nissa,' I induced her to snarl by grabbing the loose skin of her neck with my hand and growling at her. Soon she became accustomed to the part, associating a tug at her neck with snarling. An actor in apparent combat with the leopard, need only grab her neck, and she emits as savage a snarl as one would hear in any jungle.

"'Colonel' and 'Lady,' both tigers, work easily for close-ups, but not for sound. With them it is necessary to speak as well as shake a piece of cloth or a whip to guide them through a scene, and the difficulties of cutting out intermittent shouts from a trainer are too great to make this method worth while. The snarling, growling close-up is one of the most valuable scenes. Usually two

Animals Intended for Movie Careers Begin Their Training Early; Here Two Baby Lions Are Being Taught to Become Familiar with Themselves by Looking in a Mirror, a Task That They Appear to Enjoy

people appear in such a scene, one an actor and the other the trainer. While the savage beast may roar as though it wanted to tear the actor's heart out, it focuses attention on the trainer who by motion or words induces these ear-splitting noises."

Actors who enter the arena for close-up work with jaguars and leopards must be experienced. Fear registers on the animals as though it had been manifested by shouting. Any of these beasts might tear a trembling actor, unaccustomed to them, to pieces without warning. Rushes through the jungle and clearing offer fewer difficulties to directors than intimate scenes. Sometimes a whole day is consumed in rehearsing and filming a leopard, leaping snarling from a tree onto the back of an actor, and in working up the actor's nerve. First, the trainer pulls the animal down on his shoulders with a long leash fastened to the animal's body harness. Next, a verbal command, "Jump, Nissa!" and a tap on the animal's hind quarters with a whip, send her hurtling to the ground. Third, the same method induces her to leap on her trainer's back. Fourth, an off-stage human snarl or hiss causes the animal to snarl just as she leaves the tree. Fifth, cameras move in, and the 200-pound killer leaps for the actor, whose masculine dress duplicates that of the trainer.

Recently "Colonel," a 700-pound tiger, chased an actor across the clearing and

up a tree. Probably he never saw the individual, because twice earlier that morning he had been run through the same routine to find pieces of meat hung high in the tree. He growled almost in the camera's face as he reared up, striving vainly to reach the bait, hung by a rope from the end of a stick held by the trainer, high in the branches.

Usually when the script calls for a scene that bids fair to be particularly dangerous, the trainer doubles for the actor. Such an arrangement was made when one actor declined to wrestle with "Olga," a leopard, on the wing of an airplane suspended thirty feet above the ground. Mme. Celeste, the trainer, climbed out on the wing, leading the leopard behind her. She stretched out on her back with the animal on top. She took the leopard by the neck with one hand, fending off the forepaws and mouth with the other. As the animal snarled, cameras cranked. A leather belt wrapped around a strut kept them from being dashed to possible disaster.

Elephants respond quickly to the human element. The problem often is not to make an animal wilder for a given scene, but to tame a beast that suddenly goes wild under exciting circumstances. An elephant picture was being filmed on a Hollywood stage when suddenly the lights went out. The animal, wild with fright, calmed suddenly when her trainer called soothingly, "Here I am, 'Anna

Trainer Teaching a Young Leopard to Lie Still and Snarl as a Preliminary to a Movie Scene; the Leather Harness Holds the Animal on the Rock if He Tries to Jump

May." One director called for an elephant to stampede through the jungle and pull a man down from a tree. The trainer led "Anna May" through the scene three times, trotting alongside the lumbering animal. As they approached the tree, one limb of which overhung the jungle "trail," the trainer shouted, "Trumpet, 'Anna May'! Get him!" The beast emitted its jungle trumpeting sound, reached up with its trunk and pulled down the actor's double and carried him away. When ready to film the scene, the trainer stood outside camera range and at the proper time shouted the instructions.

While the animal did not understand all the words, she knew it to be her cue and she halted momentarily in her wild charge, lifted the actor off the limb and carried him on down the trail.

Oddly, while lions roar and tigers snarl in thrilling, ear-splitting close-ups, it is not always the animal actor's voice you hear. The roar of some lions produces vibrations of such low frequency that they do not sound vicious after entering the sound apparatus. In one picture, a police dog's growls were substituted.

The usual method of training wild animals, whether for circus or talkies, consists in a trainer entering an iron-barred cage with a four-legged kitchen chair. The trainer holds the chair before him. The four points are impassable. Here the lion gets his first lesson in acting: He sits back and snarls and roars at this object of hatred.

From that point, the lion soon finds himself classified in one of several classes: He becomes a leaper, a bouncer, a growler, a wrestler or a runner, for these wild animals develop specialties. Sometimes five lions will double for the principal animal actor in a picture. The close-up will show a fine-appearing animal growling, while the shots of others leaping from trees or buildings down on the shoulders of actors, dashing through the jungle underbrush, or bounding and snarling, will reveal substitutes or doubles.

Fashioning This Globe into a Prison for the Kittens, a Glass Blower Demonstrated His Ability without Harming the Feline Babies

KITTENS ARE SEALED IN GLOBE MADE BY GLASS BLOWER

Placed in a large glass tube, four kittens were imprisoned three minutes later in a twenty-six inch globe fashioned by an expert glass blower. A tiny air hole was left in the globe, and the kittens were unharmed while the globe was blown.

TELESCOPING BLADE FOR KNIFE CAN BE REPLACED

Adjusting the blade of a knife to the type of work to be done is a simple matter with a form of pocketknife containing an extension blade that slips in and out of the handle. The handle is slotted down the center and the blade is extended by pressing down and pushing forward a button for this purpose. The blade is adjustable to four positions, locking securely in each. It is easily replaced if broken.

Pit House of Early American Tribes. Entered through Burrow as Shown in Top Photo; Archaeologists Checking Measurements, Below

HOW FIRST AMERICANS LIVED IN UNDERGROUND PITS

Nests for beds in underground shelters, constructed by American tribes between 1800 and 500 B. C., have been unearthed by archaeologists of the Smithsonian Institution in the Arizona and New Mexico ruins. Pits, probably designed originally for the storage of corn, became shelters, and several of the nest beds in these burrows still show the impressions of the bodies that once slept in them. At later periods in the development of these tribes, circular houses were built to a height of two or three feet from the ground and the pits used for burial and as refuse dumps. It also was found that the earlier tribes had long, narrow heads and were slightly

two gallons of body oil. Blackfish produce about thirty-five to forty gallons of body oil, while the jaw oil averages about two gallons each. Porpoises are caught in nets, and whalers also capture them and the blackfish by harpooning.

RUBBER VULCANIZED TO METAL WITHOUT USE OF CEMENT

Through a recently developed process, rubber of any kind can be vulcanized to metal without the use of cement or flux. This method is applicable to any kind of metal and the adhesion is unaffected by extreme temperatures, chemical action, atmospheric conditions or high pressure. Hard, elastic or sponge rubber, or even rubber mixtures containing up to ninety

built. Then a new people began to migrate into the territory, a Mongoloid type with round heads, probably from Asia. While the first ancestors were spear throwers, the later types brought the bow, arrow and stone ax.

PORPOISES' JAWS YIELD FINEST LUBRICANT

Oil from the jaws of certain kinds of fish is valued highly as a lubricant for aeronautical instruments, watches and other delicate mechanisms. Porpoises and blackfish supply most of this fish-jaw oil which recently has become so scarce and so expensive that a government agency has undertaken a survey of the possible sources. Porpoise-jaw oil is produced by removing the animal's lower jaw and extracting the oil containing blubber which is boiled gently. A single jaw yields about one-half pint of such oil while the porpoise also yields about

WEATHER UNIT FOR HOME KEEPS AIR WARM OR COOL

Conditioned air for the home has been made possible by a weather cabinet which cools and dehumidifies the atmosphere in summer and humidifies and circulates warm air from the heating system in winter. The unit, looking like the ordinary radiator, consists of a series of coils in a case, and two fans which circulate the air slowly. The air is forced from the bottom, over the coils and into the room. In summer, water kept at a temperature of forty degrees, circulates through the coils. The weather unit is connected to a refrigerator or icebox in summer. In winter, the heating-system pipes pass beside the idle cooling coils, heating the air.

"Bob," Boston Terrier That Has Served as the Model for 100,000 Casts, and His Master Who Produces Them

MODEL OF FAMOUS DOG COPIED HUNDRED THOUSAND TIMES

"Bob," the Boston terrier, that is so widely sold in novelty stores and given as prizes at amusement parks all over the United States, is the model of a real "Bob" who first posed eleven years ago. Recently the one-hundred thousandth cast of "Bob" was completed by the model maker in California. A series of glue molds are employed into which the plaster of paris is poured.

A 2371

SUNSPOTS COOL THE EARTH

Sunspots are like giant electric refrigerators and, when most numerous, reduce the earth's temperature by one degree. The spots, says Dr. Henry N. Russell of Princeton University, become more numerous every eleven years, but for the next three years, the minimum will be reached, almost eliminating electrical interference with telegraph and radio instruments. While the temperature of a sunspot is about 4,700 degrees centigrade, this is 1,000 degrees cooler than the sun's spotfree surface.

Giant Water-Cooled Tube That Bounces Waves from U. S. to Hawaii, in Right Hand; All the Tubes Are Used in One Sending Station

VOICE BOUNCES OFF UPPER AIR FROM U. S. TO HONOLULU

"Sky waves," rivaling tales of Arabian nights, were shot 200 miles high against the surface of the upper atmosphere known as the Heaviside layer, then bounced down to Honolulu with the opening of trans-Pacific radio-telephone service between Dixon, Calif., and Hawaii. The receiving and sending divisions at each end of the system cost a total of approximately \$750,000. The largest tube in the Dixon station has a capacity of 10,000 watts and is water-cooled. Water and air heated by the 10,000 volts necessary to operate the station are cooled by three fans, each three feet in diameter.

LIGHTED CIGARET IS DELIVERED FROM DESK CONTAINER

Lighted cigarets are served singly from a container for the desk or table that includes an electric lighter operated automatically. Contact with the heating element is made when a door is pressed back to bring out the cigaret from the cabinet. As it is pulled forward, it is pressed against the lighter. The cabinet

is of bakelite finished in chrome plate, silver or gold, and the outfit includes a snuffer and a removable tray.

METAL REGAINED FROM ASHES OF SCRAP

Like the packing plant that utilizes everything but the pig's squeal, the General Electric company recovers most of the metal from the ashes of its scrap incinerator. The ashes are pulverized, then run over a magnetic separator which removes the magnetic scrap from the non-magnetic material, such as brass, copper

and aluminum. The residue is passed over a grooved concentrating table with a stream of water flowing crosswise, which washes into the grooves the heavier metal and throws off the ashes. By this method about 100,000 pounds of ashes are ground and washed, and from 20,000 to 25,000 pounds of metal and other material recovered. This is worth about \$16,000 a year.

TILE THAT SNAPS ONTO WALL AND FLOOR SAVES LABOR

Time and labor are saved, and the debris that usually litters the kitchen or bathroom undergoing remodeling is obviated by means of a metal lath which allows the tile to be literally snapped on the wall and floor. The lath is a punched sheet of metal with special mechanically formed fingers, or grippers, projecting at right angles. These provide a frictional grip to the tile material and center it in a predetermined position on the wall. It is said the new system gives the tiling job a structural value which merely pasting it on does not afford, all at a lower cost.

A GIANT'S TASK-

Cleaning Statue of Liberty

WHEN a small army of men set about to overhaul and clean the statue of Liberty, they faced a task equal to one of Hercules', but where he solved his problem in a jiffy by turning the Alphens river on the Augean stables, it's not as easy as that in actual life.

Yet miracles were performed on the statue—miracles far surpassing any of those achieved in mythology. That small army of men turned all the known forces of science on this largest of all statues. They performed miracles which are not here and gone in the wink of an eye but remain for all who enter New York harbor to see. In truth, they were not real miracles—of course not. They were the

Looking Down from Torch of Statue of Liberty, and
Statue Illuminated at Night

of about 500,000 candlepower is enough to light 250 homes. According to the Westinghouse Electric experts, the "rejuvenation" of the statue entailed some of the most complicated problems ever attempted. It was only after hundreds of experiments and months of work that a successful floodlighting system was installed.

An entirely new feature of the giant statue is the effect of a sparkling crown which gives the world-famed lady a regal appearance. This was made possible by the installation of specially made lights in each of the twenty-one windows of the crown of the statue. A blinker system creates the impression of glittering jewels.

While under the old lighting system the statue looked some-

height of twentieth-century achievement.

For forty-five years the statue has stood in New York harbor. But during these years the reception of Miss Liberty has been palpable only half of each day. During the other half the great bulk, towering above little Bedloe's island, has been only a misty mass at a distance of a few hundred yards. What light she had was very small indeed.

But now Miss Liberty proudly stands as the world's greatest statue twenty-four hours a day. Today there is no statue or structure anywhere that equals her in height, light and massiveness. Indeed, now she is a more marvelous sight by night than by day. After dark, the huge shining figure illuminates the entire harbor, and is visible twenty miles away.

Her new floodlighting system

Above, 115-Foot Spiral Stair Leading to Head of Statue; Below, Mystery Prison Found beneath the Figure

what clean in parts at night, there was hardly a clean spot on her in broad daylight. After many complaints had been filed with the government, a committee of experts were told to devise some method by which the statue could be scrubbed. Soon thereafter little black spots—hired men—were seen traversing the wide and dangerously curved expanse of the statue. High-pressure hose and steam brushes were of little avail against the incrustations of dirt. Electric washers were called into use.

Next came the problem of "sewing" up Miss Liberty. Time had battered, frayed and cut through her gown, and there were about a hundred holes. Her jaw and cheek looked bullet-riddled.

The method of repair was long and laborious. Those plates in which there were the most perforations, or those that had been worn thinnest, were removed. These

Top Photo by U. S. Army Air Corps

Above, Aerial Photo of Statue Made at Night by Glare from Flashlight Bomb; Below, Guard Climbing Inside of Arm to Torch

were used for patterns for new plates, because every plate on its interior corresponds exactly to the exterior.

And then Miss Liberty was presented with a brand-new elevator and an automatic switch. This turns on the lights at dusk and cuts them off at dawn.

Valve Grinder with a Rubber-Tipped Vacuum Cup in Which the Abrasive Compound Is Placed

RUBBER-TIPPED VALVE GRINDER IS EASY TO OPERATE

Grinding valves is now accomplished with a tool made of rubber instead of high-tempered steel. The rubber valve grinder consists of a cylinder, at each end of which is a suction cup. The grinding compound is placed in the cup and the tool is revolved between the palms of the hands.

HOW QUEER GOODS ARE SHIPPED

New types of commodities are constantly coming on the market, bringing to the railroads and shippers new problems of handling to avoid loss or damage. Neon-light

sign tubes required considerable experimentation before a way was found of transporting them without breakage. The extremely fragile tubes finally were fastened to frames of chicken wire, which in turn were suspended by strips of rubber inside a solid box. This method eliminated most of the shock of handling before it affected the tubes. Live snails also taxed the ingenuity of shippers for a long time. Now, specially constructed cans, filled with water in which the snails lived before they started traveling, are used. The shippers also pay to have these containers returned, since the usual rough handling of empties would ruin the cans. Live fish-worms, water plants, dynamite, gas and large radio-broadcast tubes are among other items for which special methods of packing have been devised.

Creating Artificial Current in a Pool with an Outboard Motor, to Train Swimmers for Open-Water Competition; the Swimmers Fight the Current by Splashing Toward the Motor

OUTBOARD IN SWIMMING POOL HELPS TRAIN RACERS

Swimmers training for open-water competition in the narrow confines of a pool often are handicapped because the water is still while in an actual contest currents may play an important part. The coach of a Seattle team solved this difficulty by creating an artificial current in the pool with an outboard motor. This motor was placed at one end of the pool to churn up the water, and the practicing swimmers fought their way against the current by proceeding toward the motor.

DIRECTION FINDER FOR STORMS TESTED FOR NAVY

Hurricanes and other weather disturbances in the Caribbean sea and the Gulf of Mexico may be tracked down, and all shipping and air traffic cleared from their paths through a static direction finder developed in the U. S. Navy department. The instrument is being tested and, if found satisfactory, installations will be

made at four points in the Caribbean area. By means of the direction finders, bearings will be taken to locate the centers of static associated with hurricanes and thus trace the course of the storms. Advance warnings to ships and airplanes in the path of the hurricanes would be possible.

ELECTRIC HEATER ALSO COOLS WITH ICE WATER

Warm or cool air, as required, is circulated by a small portable electric air conditioner for the home. In emitting warm air the unit operates like any other electric heater, but when used as a cooler, a radiator inside the metal case is filled with ice water and the switch turned to the

cool position. Operating in this manner; the conditioner circulates a stream of air cooled by the ice water.

Latest War Tank at Home on Land or Water

Views of Amphibian War Tank in Water and on Land; It Has a Land Speed of About Forty Miles an Hour

Water offers no obstacles to an amphibian war tank recently tested in England, for it can speed over the ground at forty miles an hour, then plunge into and swim

across any river in its path. It is virtually a combined land and water battleship, for when in the water a steel turret containing small guns protrudes above the surface, so it can attack as it swims. A small propeller gives the tank a speed of about seven miles an hour in the water, while on land it can lumber over five-foot ditches with vertical banks, climb a steep grade at six miles an hour, or race across flat country at forty miles. The land-water tank was evolved after a satisfactory method was found for making elastic water-tight joints. Several years ago, an amphibian tank was tried out, but it sank, due to the development of leaks in its non-elastic joints after rough cross-country travel. In actual warfare, such weapons may revolutionize defense tactics, since forces guarding river banks and bridge heads are robbed of the temporary security offered by deep streams, as the tanks can span such obstacles quickly and are proof against armor-piercing bullets, even at 150 yards. In the water, only the turret and two float-mudguards are visible, while on land its appearance is similar to that of the ordinary army tank.

CLUES TO PREHISTORIC PEOPLE SOUGHT IN DEATH VALLEY

Evidences of prehistoric occupation are being sought in Saline and Death valleys in California by an expedition of scientists representing two California museums. A detailed survey is being made of the region, long regarded as always uninhabitable, on a theory that Death Valley may at one time have been the habitat of a tribe of Indians. In the northern part of the valley, various ancient Indian remains are said to have been discovered from time to time.

ELECTRIC EYES FOR AIRPLANES
"SEE" THROUGH FOG 248

Fog, one of the greatest handicaps of the aviation industry, may be overcome by equipping airplanes with electric eyes, or photo-electric cells. Experiments conducted by the General Electric research laboratory indicate that such an eye in an airplane can penetrate dense fog and "see" beacons on the ground entirely invisible to the pilot, thus enabling the pilot to hold his course or find a landing field. The operation depends on the fact that the photo-electric cell is very sensitive to diffused light, and all light passing through fog is diffused. To make sure that the electric eye picks up only beacons, and not any light on the ground, it is suggested that the beacons be fed with a 1,000-cycle current to give a rapidly flickering light. Since ordinary lights use either a sixty-cycle or direct current, it will be possible to isolate the 1,000-cycle signals. Even in full moonlight, it is claimed the eye can detect a diffused modulated light of an intensity only one thirteen-thousandths that of a diffused flashing light just visible to the eye.

MANCHURIA

By UTHAI VINCENT WILCOX

TO understand the situation in the Far East, the South Manchurian railway must be considered first. This is no strangling narrow-gauge trackage stretching across the steppes. It is a thoroughly modern, adequate, forward-looking railway. The equipment is American, the track is standard, the cars and locomotives are American-built and of the latest type.

Japan owns this railway. It is operated with government funds. It is Japan's contribution to the development of rich and wealthy Manchuria, which embraces the three eastern provinces of China—and is about equal in size to Texas, New York and Pennsylvania combined. Its soil generally is of almost exhaustless fertility, and it possesses immense potential resources in agriculture, timber and mineral wealth. Along the lines of the South Manchurian railway, there are modern flour mills, bean-oil mills, soap works, sugar refineries, sawmills, distilleries, breweries, glass factories, tanneries and ore mines.

Thirty years ago, Manchuria had no railways and its population was less than 2,000,000. Today its railways total nearly 4,000 miles, or about as much as the whole of the rest of China, and the population, according to recent estimates, is over 27,000,000. Railway development has brought into Manchuria probably the greatest colonization movement that has ever taken place in history, in an area of similar size

Above, South Manchurian Railway Yards at Dairen; Below, a Japanese Soldier

What is it all about?

and in a similar length of time. In one month, recently, approximately 200,000 immigrants passed through the Southern Manchurian railway controlled port of Dairen. These are permanent colonists. On Sept. 5, 1905, the Japanese government, by virtue of the treaty of peace between Russia and Japan, acquired the railway main line through Manchuria from Changchun to Dalny and Port Arthur, together with its branch lines and all rights and privileges, including the coal mines formerly owned by the Chinese Eastern railway. It will be seen that Japan is intensely interested in Manchuria by reason of its railway lines. It would be comparable to the ownership and control of one of America's transcontinental lines by a European power which sought to develop every railway interest even to ports, mines and factories along its right of way.

Dairen is the terminus of this modern railway of the East. In the early days the Chinese had a name for the town which meant "Black Mud Hollow"; then the British and the French made it a base of operation when attacking Peking, and later it was leased to Russia. The Japanese were quick to realize its possibilities; in fact, quicker than the Russians had been. They abandoned Port Arthur, not far distant, and concentrated on Dai-

Camouflaged Japanese Armored Train, and Chinese Civilian Reading Proclamation

ren. They changed the name to the present one which, literally, means "great connection."

The South Manchurian railway operates steelworks, collieries, waterworks, electric plants, gasworks, building projects, laboratories and experiment stations; and, according to one of its official bulletins, "city building and administration." It even goes farther than that; it conducts schools, hospitals, hotels, banks, clubs, bureaus, and so forth, until there seems to be no end to its undertakings.

But the railway is interested in more than mere transportation. First, there is the famous Fushun colliery. This great coal mine, or rather series of mines, is but twenty-two miles southeast of Mukden. The mines are remarkable for the thickness of their seams. The daily output at present is 20,000 tons, with a conservatively estimated potential output of 1,200,000,000 tons.

Top, Wharves at Dairen; Center, Map of Manchurian Railways; Below, Partial View of Anshan Steelworks

Top, Japanese Troops Halting a Train of the Manchurian Railway to Search for Chinese Troops Believed Concealed in It; Right, an Armored Car Used by the Chinese during the Manchurian Fighting; Note the Camouflaged Effect; Below, a Peaceful Scene along the Route of the South Manchurian Railway; Chinese Pottery Makers at Work

may soon rival all others east of Suez. The Japanese themselves claim that the future source of steel in the Far East is located at Anshan. The railway acts as the godfather to these factories and to the extensive mines of iron ore. There are several blast furnaces in operation with an ultimate annual production of 1,000,000 tons in sight.

It would be tiresome, perhaps, to note in detail the long list of industries operated in that ancient land. Such a list includes coke ovens, sulphate-of-ammonia factories, gas-works, libraries, technical schools, playgrounds and bean mills. There is a medical college (Nanman Igakudo) which should be included.

The school work of the railway is another evidence of the vision of the owners. In order to encourage education among the children, the railway grants free passage to those who attend schools along its right of way.

The laboratories, operated by the technical staff of the railway, are now developing native crafts to compete with western ways. Studies are being carried on in the dyeing and weaving industries, in silk filature, in ceramic art, in methods for manufacturing salt, glass, pulp for paper from Kaoliang stalks, analyses of coal and iron ores and experiments in the possibilities of the soya bean.

Then there are the great Anshan steelworks. American engineers estimate that these works

the nettle family, will grow anywhere cotton grows, and Louisiana bankers are interested in its production in that state. Ramie has been used from time immemorial, the Egyptians wrapping their mummies in it, but the laborious process of removing the impurities has made the cloth too costly.

SAND NOZZLE HAS LONGER LIFE AND NEEDS NO COUPLING

Much of the expense and time lost in changing nozzles used by sand blasters has been cut by a new nozzle made of a more resistant alloy and having no heavy coupling. Whereas the average nozzle lasts from twenty minutes to an hour in constant service, the new one is guaranteed to last eight hours. Finer work is possible by lengthening the nozzle to seven inches and reducing the weight added by the coupling. The new nozzle slips inside the hose and is fastened by a clamp. A special alloy resulted from more than a year of experimentation, which is able to withstand much greater amounts of the sand forced by high air pressure through the outlet orifice.

TEAR-GAS SHOOTER FITS HAND AND PROTECTS OWNER

When the barrel of a tear-gas shooter now on the market is released by pressing a button, it springs backward, discharging the shell and firing a cloud of gas. To shoot the weapon, the shell is inserted and the pistol-barrel pulled forward. A touch of the button does the rest. The shooter is made of steel and fires paper gas shells.

GAS PUMP IN SHAPE OF SPHINX DRAWS ENGLISH TRADE

Gasoline Flows through a Hose in Mouth of Sphinx, with Which This Filling Station Is Decorated

English motorists have been attracted to one filling station by a gasoline pump in the shape of a Sphinx. The rubber-hose pipe runs through the Sphinx' mouth to the automobile tank.

CROPS HIGH IN VITAMINS URGED TO SOLVE FARM PROBLEMS

Crops high in vitamins are urged by Dr. Walter Hough, of the National Museum, Washington, D. C., as the solution of the farm problem. Production of efficient foods would eliminate the farmers' burden of raising needless crops, says Doctor Hough, who would have the farmer concentrate on limited, more valuable crops, saving labor and giving him more leisure. Under such a condition, a census of farm products in demand and the supply would be necessary to get a proper correlation. This infers a control of acreage put into crops and suggests a concentration of effort on the best lands for certain crops, thus getting the diversity of required products in the best localities and throwing unused lands into forests.

Capt. Thos. W. Sheridan
Little Neck L. I. N. Y.

Why A Huge LINER

An Old-Fashioned Windjammer in Dirty Weather; the Vessel Is the Full-Rigged Clipper "Seven Seas," Formerly a Swedish Ship

By CAPT. THOS. W. SHERIDAN

MANY mysterious accidents and curious actions of steamships under way, which in the past were ascribed by superstitious seamen to supernatural causes, are now known to be the result of the action of simple hydrodynamic (water pressure) phenomena. "Suction," "smelling the

bottom," "sucking the bank" and "squat" are all seamen's terms for various manifestations of this kind. Twenty years ago, a curious catastrophe, at first apparently inexplicable, resulted in an admiralty action which drew the attention of the world to the existence of suction between moving ships. The giant "Olympic"—then the new marine wonder of the world—was bound out to sea from Southampton and had turned to go out through the Nar. The cruiser "Hawke" was steering along on a course parallel to the "Olympic's." The "Hawke" had come up from astern and was overhauling the "Olympic." Its bow just passed even with the "Olympic's" stern when suddenly, as if pulled in by the irresistible attraction of a monster magnet, the "Hawke" sheered in toward the "Olympic." The rudder was put hard over to stop the sheer and the engines backed, but in spite of all efforts, the "Hawke" cut a great gash in the liner's starboard quarter.

Since then, there have been many other accidents, due to apparently eccentric actions of ships, that made many "Salty Solomons" shake their heads and agree with the "Singing King" that it was indeed hard to understand "the way of a ship in the sea." Sometimes these occurrences were due to the suction between two ships, sometimes a ship would suck the bank on

Runs AMUCK!

one side of a channel and sheer right off into the middle of the stream against its helm with disastrous results to itself or anything in the way, or there were cases of a ship becoming uncontrollable due to smelling the bottom when going too fast in shoal water. Although frequently incomprehensible to the puzzled persons involved, these things are very easily explained.

A moving ship cuts a lane, so to speak, through the water. The fluid ahead is pushed out of the way in a direction perpendicular to the shell of the ship at point of contact—ahead, down, right, left. Astern, the water rushes in to fill the cavity. It is the currents caused and pressure differences cre-

"Empress of Britain," Top, and "Mauretania," Below, in Floating Drydocks

ated by the transportation of the vast mass of fluid moved by the progress of a ship that cause these hydrodynamic phenomena.

Every time a ship under way has progressed a distance equal to its own length, it transposes a mass of fluid equal to its own displacement in weight and volume—that is the actual weight of the ship in pounds or tons and its underwater volume. Thus even a small freighter of 10,000 tons' displacement, of the average length for a ship of that size of 375 feet, going at the moderate speed of ten knots, will push out at the bow and suck in at the stern a weight of water of 26,666 tons every minute.

Obviously, any object in

Above, Drydocking the "Majestic"; Below, Diagram Showing Forces Causing Collision of "Olympic" and "Hawke"

the path of the current of this vast moving mass of water will be affected by it. Near the bow the object will be repelled from the ship and at the stern it will be sucked in toward the ship. Between ships

this suction effect is at its maximum when the bow of one ship is abreast of the stern of the other and collisions are most likely to occur when one ship is overhauling another and its bow has just become even with the other's stern, which is what happened in the "Olympic" case.

Towed or sailing ships do not show the intense suction action at the stern that steamers do. The propeller in the latter shoots the water back and thus increases the cavity at the stern. On account of this strong back push, the inflow must take place entirely from the sides and up from the bottom. This increases the strength of the inflow over what it would be if there were no propeller.

Sucking the bank frequently occurs in narrow, shallow canals or channels. In this case, the bow is repelled and stern attracted by the nearest bank on one side of the ship's course. The outward flow of water, being impeded by the bank at the bow end, and the inward

flow reduced at the stern cause a pressure to be built up forward, and a suction (reduced pressure) at the stern, on the bank side. The result is that the ship turns away from that side and sheers out into the middle of the stream, on account of this twisting effect.

During the war, the writer had a curious experience of bank suction. Toward the end of the war, it was the custom to sail the convoys in the daytime in the English channel and to hug the shore as closely as possible in order to frustrate submarine attack from the shoreward side. On one such occasion the writer was in command of the last ship in a column. Suddenly the first ship took a broad sheer to port and, in sequence, the whole column seemed to run wild. At first we thought it was an attack and then the same thing happened to the writer's ship in spite of the rudder. The explanation is that we had suddenly entered into shoal water with a pronounced bank on our starboard hand.

Above, "Aquitania" Battling Mountainous Seas; Below, Diagram Illustrating Bank or Shoal Suction

It is probable that the ship's sheering was not due to bank suction alone, but that the smelling-the-bottom characteristic of ships in shoal water had its effect. Due to the impediment to the free flow of

Above, Propeller of "Empress of Japan"; Right, "Olympic" after Collision with the "Hawke"

water into the cavity, left by the ship, caused by the proximity of the bottom, all propelled vessels steer wildly when proceeding at any speed in shoal water.

Twist or multiple-screw vessels steer and sheer wildly when smelling the bottom, but they do not favor any particular direction of sheer. On the other hand, single-screw ships nearly always sheer to the left of the course when this occurs even if the sea bottom is level. This is due to the fact that the propellers revolve right-handed—the same as the hands of a clock—and thus the water is sucked in on the lower starboard (right) side and expelled on the lower port hand. By impeding the inward and outward flow, the proximity of the bottom builds up a pressure on the port side of the stern and reduces it on the starboard side, and the twisting effect causes the stern to go to the right, which, of course, turns the bow to the left.

Squatting is another disconcerting manifestation of hydrodynamics which worried the minds of mariners in the first days of steamships, and often does yet. It is the tendency which ships have to sink

down in the water, at the stern, as they speed along. It is due to the reduced buoyancy of the water owing to the stern cavity. While all ocean ships have this tendency on account of being deep and narrow, some shallow and broad boats have the opposite tendency and actually hydroplane to a certain extent.

In close and shallow waters the squatting tendency is increased and ships navigated by the

unwary at high speeds, bump on the bottom in places where the water is several feet deeper than the ship's draft. Some years ago, the writer was present at experiments off Robbins reef to determine ships' squat. At eighteen knots, the American liner "New York" squatted over seven feet by accurate observations.

BIG DYNAMOS RUN IN HYDROGEN TO CUT WIND LOSSES

While big dynamos are highly efficient, often delivering as much as ninety-seven per cent of the power input, a means recently has been found to make them even more so, by running them in hydrogen instead of air. Resistance of air in a 100,000-kilowatt unit may be as high as 900 horsepower, while operating it in an atmosphere of hydrogen, which is more tenuous, adds about one per cent to its efficiency. The method has been adopted only in the case of very large units.

FARE BOX ALSO MAKES CHANGE ON BUS OR STREET CAR

Fare boxes for busses or street cars that also make change relieve the operators of the responsibility of handling the passengers' money. To obtain change, the rider drops his coin in one of several slots taking from a nickel to a dollar. He or the operator then presses a button that causes the change to drop into a hopper. The passenger deposits his fare in another hopper at the top of the machine, and the operator presses a second button which drops the fare into the interior of the box and registers the amount. The only responsibility of the operator is in changing paper money. He can accept a dollar bill and press a lever which causes the fare box to issue a dollar's worth of change. The same operation records the fact that the conductor or driver has accepted the bill, charging him with whatever amount of change is issued. Coins dropped into the device are automatically segregated according to denomination.

ELECTRIC ICE-CREAM FACTORY WILL FIT IN SMALL SHOP

Requiring no more space than a large refrigerator, an electric ice-cream factory is now on the market, designed especially

Here's a Whole Ice-Cream Factory in a Cabinet: It Produces Five Gallons at a Time

for small shops wishing to produce their own cream quickly and economically. The miniature factory consists of refrigerating unit, ice-cream freezer, an agitator in which knives and paddles produce a double mixing motion, and the hardening compartment. All parts are inclosed in or attached to a cabinet resembling a refrigerator. The makers say that the double mixing motion of the agitator results in a "super-creamed" product. Five gallons of cream is the capacity of the freezer.

AUTO KEYS FOLD INTO HANDLE OF POCKET HOLDER

Ignition, tire and door keys of your automobile may be carried in a pocket holder now on the market. The holder has a hollow handle into which the keys are folded. The over-all length is three inches, while there is space for your name or advertising available on each side.

Long Experiments Led to a Process for Engraving in Wood Portraits Which Will Not Fade

PORTRAIT ENGRAINED ON WOOD WILL NOT FADE WITH AGE

Portrait making on wood has been developed by a California artist who follows the grain of the wood in bringing out the lights and shadows necessary to produce a picture. The artist, who has worked thirty years on the process, says the wood-grain portraits will not fade. The process calls for working the portrait into the grain so that it becomes part of the wood and can be removed only by scraping or cutting the surface.

"ELECTRIC EYE" IS PAINLESS TIME SAVER

Man is being released from routine work by application of the photo-electric cell to the meaner services of seeing, says Dr. Willis R. Whitney, of the General Electric company. The tube, known as the "electric eye," is much more accurate and sensitive than the eye of man, it can keep uninterrupted watch for hours at a stretch, it can measure hundreds of things, including light, more accurately than human operators, and it can see light rays entirely outside the range of the human eye. These rays include the ultraviolet, infra-red and X-ray. Doctor Whitney

sees the eye as a painless process of saving time, releasing man from mere routine to engage in other pursuits. The photo tube can be standardized and calibrated. It can fix its attention exclusively upon one spot in a glowing furnace just as well as upon some distant star, helping the steel treater or the astronomer. It will not grow tired and it will not wink, proving its superiority over the human organ.

TALKING PLANE FIGHTS REBELS WITH WORDS FROM AIR

Aerial broadcasting apparatus has been installed in a British transport plane for use among the tribesmen of Iraq. Authorities believe that the effect of a voice from the sky may serve to disperse the natives in rebellion. It is also felt that spoken warnings, issued in booming voices, will have much greater effect than leaflets dropped among the villages. It is hoped that the new means will subdue revolts without having to resort to more forceful methods. The apparatus installed amplifies the voice more than a million times and makes it possible for a speaker to be heard plainly from altitudes of 3,000 to 4,000 feet.

RUBBER BASE FOR UPHOLSTERY TAKES PLACE OF SPRINGS

Sponge rubber made directly from latex is being employed in place of hair and spring filling in a new type of upholstery. The rubber sponges are molded in tiers, slabs or honeycomb forms and can be bottomed to a diaphragm consisting either of sheet rubber or interlaced strips, mounted on a steel frame. Unusual comfort and resiliency are claimed for the method.

Yucca Breakaway Furniture Is Used in Movies

Wood That Weighs Only Half as Much as Balsa Makes Those Properties That Break So Easily in the Movies

Motion-picture comedy actors who fight with chairs and other implements use "breakaway" furniture made of wood that is so light it never hurts. A club may shatter realistically over a comedian's head, but he hardly feels the blow. Guns and hammers that appear to be dangerous weapons on the screen actually weigh only a few ounces. The lightest material that the studios can obtain for this furniture is the pith of the picturesque yucca, otherwise known as the Spanish bayonet. Scouts are sent into the southwestern desert to gather the stalks, some of which

are thirty feet high. The pith of the yucca has the same texture as heavy wood, but it weighs only half as much as balsa. A block of it can be crushed easily in the hand, yet it is sturdy enough to cut into thin boards and make into such articles as tables and pianos. Otto A. Oie, Hollywood's master carpenter of breakaway furniture, makes up realistic chairs that weigh four or five ounces and that can hardly be distinguished from their sixteen-pound originals. Large pieces, such as chair legs and rungs, are held together with toothpicks. Smaller pieces are glued.

HOME AIR FILTERS TO RELIEVE HAY-FEVER VICTIMS

Air filters to help victims of hay fever soon will be available for installation in homes. Experiments at the University of Illinois have shown that filtered air relieves the malady in from thirty minutes to one and one-half hours, permitting sound sleep. Use of filtering machines in bedrooms would relieve a large percentage of the 2,500,000 to 6,000,000 hay-fever

sufferers in the United States, since they would be exposed to irritating pollen only during the day. In one ward at the university hospital, 100 persons were observed. Most symptoms were relieved shortly after the patients entered the ward after their customary activities during the day. However, the relief was not complete, as most of them had a mild attack in the morning on awakening. Improvement in the filtering process is expected to give better results.

CAMERA TRICKS in the TALKIES

ACROSS the screen hundreds of soldiers mill about. One hundred and five lenses, opening in front of a single strip of motion-picture film, record the scene. The "button glass" is the newest movie device intended to aid sound equipment in providing further illusions and entertainment.

Many new "tricks" and devices to aid the eye are sweeping the studios. Whereas the button glass revealed several hundred soldiers, in reality there was a much smaller number. Here is how it works: ~~Placed~~ ^{Placed} in front of a camera, the button lens causes

an individual to look like parts of 105 individuals, small in size, yet separate and distinct. When the lens is revolved, the scene becomes distorted, and the tiny scenes roll and turn over each other.

The button glass is only one of the trick devices recently adapted by Lloyd Knechtel, Radio Pictures' trick photographer, to screen use. Triangular mirrors, a crystal ball cut from a doorknob, reflecting lenses, revolving prisms by which airplanes are made to spin without actually turning in the air, contribute to the realistic portrayal of scenes.

Above, View of One Actress through the "Button Glass" Which Makes Her Look Like a Crowd; Below, Glass in Place before the Camera

Film Strip Showing "Lap Dissolve," by Which One Scene Merges into Another without Abrupt Change

The "lap dissolve" enables the producer to merge one scene into another without abrupt change. Suppose the script calls for a spinning plane to dissolve into a

close-up of wreckage. Both scenes are recorded, possibly on separate films in separate cameras at different times and locations. In the laboratory, the last views of the spinning plane gradually are faded and the first few feet of the wreckage are faded. Then the two films are overlapped and double-exposed. The result is a merging of the two scenes.

Another interesting effect has been obtained by shooting through a crystal doorknob. The movies have taken many keyhole scenes, but the doorknob came into use after it had been cut in diamond shape and repolished. The high-grade plate, fitted close against the lens, gives a multiple-image effect.

And now a way has been devised to cause a camera to focus automatically as it backs away from a close-up, keeping both the principal actor and the whole scene in focus.

Suppose the opening shows a star, possibly only the face, and the director calls for the camera to be moved slowly backward. The lens quits staring into the actor's eyes from a distance of one foot and moves back 150 feet on the four-wheeled dolly. As it rolls back, cams and gears regulate the focus automatically to keep the star in his proper proportion to the entire scene.

These tricks of camera and cutting room have enabled the talkies to develop much like a book. The automatic focus represents a paragraph in its effect, while lap dissolves take the place of chapters. And the trick lenses represent literary devices to capture the reader's attention.

READER IS BLIND PART OF TIME AS EYES SCAN PAGES

When you read, you are entirely blind during all but tiny parts of seconds. These periods have been measured by Frank K. Moss, a research engineer for a lighting laboratory, who found that they ranged from seven to fifteen-hundredths of a second. As you read a line, your eyes move and stop at short intervals. While the eyes are in motion they "pick up" the reading matter, but the connection to the brain is shut off. In reading it was found the average person is blind about three-tenths of a second at a time. The eye ac-

Rule Part

NY. Herald Tribune 9 22 95
11/13/31

curately measures this interval, and if you did not pick up what you read in the specified interval, you probably would not be able to read. In conducting the experiments, an accurately timed rotating disk was used. It was painted white and pierced in the center with two parallel slits. How the vision lagged behind the actual position of the parallel slits in relation to the horizontal was made known by the subjects through signals. More than 150,000 measurements were made with varied intensities of light to determine how much light the eyes need for comfort while at work. From these tests, it was estimated they require about thirteen times as much as they get from customary office lighting, which averages in strength that of an eight-candlepower lamp on a sheet of paper held a foot away.

Scientist at a Middle-Western University Testing the "Teletactor" by Which Deaf Can Hear with Their Fingers

DEAF CAN HEAR WITH FINGERS BY AID OF "TELETACTOR"

Totally deaf persons now can hear with their fingers by means of an instrument, the "teletactor," devised by a professor at a middle-western university. The speaker talks into a small microphone and his words are carried through an amplifier into a small receiver or vibrator on which the listener places his digits. With a little practice, the deaf can learn to recognize words and sounds by the vibrations they produce against their finger tips.

WRENCH FITTING EIGHT BOLTS HAS SWIVEL SOCKETS

Swivel sockets in both ends of a wrench now on the market are made to fit eight sizes of bolts or nuts. An index spring to retain the working opening in position allows the wrench handle to be operated at practically any angle. The tool is drop-forged and heat-treated, and is guaranteed against breakage.

Swivel Sockets to Fit Eight Different Bolts Make This Wrench Useful around the Auto

CHAIRS OF METAL MAGNESIUM MAKE PLANES LIGHTER

Elektron, an alloy of magnesium manufactured only in Germany and Italy, rapidly is coming into widespread use particularly in the field of aviation. Aircraft builders have adopted it for parts of motors, wings, fuselage and even for interiors. The Lufthansa recently installed chairs and other furnishings of elektron in several of its larger planes. The substance has a specific weight of 1.8, considerably lower than even the aluminum alloys, while it melts readily at between 625 and 650 degrees Centigrade. It oxidizes slowly, and while the white oxide formed on the outside of the metal does not impair its strength, in aviation employment a brass paint usually is applied for a protective coating. It has also found favor in the manufacture of cable cars, etc.

"Economy" Plane, and, at Left, the Tiny but Powerful Engine That Flies It

with a geared propeller and without valves in the ordinary sense. The pistons perform the work of the valves, letting the gas in and pushing the exhaust out. Also, each stroke of the pistons results in an explosion, contrary to the usual four-cycle method of explosions every two strokes, thus giving the engine eight-cylinder efficiency. The craft is expected to have a landing speed of thirty-five miles an hour, a top of 100 miles and a cruising radius of 340 miles at eighty-five miles an hour with a fuel load of sixteen gallons of ordinary automobile gasoline. The engine, twenty-three inches in diameter, is equipped with a supercharger and intended to develop fifty-eight horsepower.

SUBSTITUTE FOR COTTON FOUND IN THE YUCCA PLANT

Germany has developed a substitute for cotton from the yucca plant, which is also common in America. By artificial culture and fertilization, and by crossbreeding, new plants are developed in about six weeks. The refinement of the fibers is simple and its worth as a cotton substitute is satisfactory, the price in Germany being about half that of cotton. The refining process has been patented.

"VACUUM BOOSTER" FOR PUMPS ENDS DEEP-WELL ILLS

Suction pumping of deep wells is accomplished by a new system which has the additional advantage that all pump parts are on top of the ground. In the ordinary suction-force or centrifugal turbine pump, the action takes place below the water level and is therefore inaccessible in case of trouble. In the new pump, however, a chamber is placed in the well line, a few feet below the point where natural suction ceases. Water is sucked into the chamber, and there, by an arrangement of pressure valves connected with the pump at the top, atmospheric pressure is introduced on the head of water in the chamber, allowing a second intake pipe to pick up the flow. The installation also can be so arranged as to introduce greater than atmospheric pressure on the chamber and bring the water to the desired level under pressure and more speedily. The action of the pump, while in reality two-stage, is so perfectly controlled by the valve adjustments that the flow of water is continuous. The pump unit may even be placed at some distance from the well, as in a basement or attic, if desired.

LIGHT CURRENT RUNS HAMMER FOR METAL WORKERS

Light-socket voltage is all that is required to operate an electric power hammer designed for metal workers. The machine eliminates the necessity of high-power installations, heavy foundations and excessive space, usually required for a trip hammer. It is designed particularly for automobile and airplane workers.

Power Hammer That Operates from Light Socket Necessary in Many Varieties of Machine Shop

Portable Power Hammer
Tool Co. 2208

What AVIATION

By CORLEY McDARMENT

AVIATION is rapidly changing the entire economic system of the world just as the scheme of things was altered by highway development, Col. Halsey Dunwoody, vice president of American Airways Inc., declares.

"Our country's progress has followed the evolution of transportation," he points out. "The most marvelous thing in the world is the human mind. Next in importance is communication, which enables

one mind to share its product with another. Then comes transportation, which enables the movement of material things, and man with his powers of observation and expression."

Just a few years ago Orville Wright, father of aviation, stated that no airplane could fly eighty miles an hour, but today a speed of 415 miles an hour has been

422 E 142nd St. New York, N.Y.
Ramsey
422 E 142nd St. New York, N.Y.
Louis & Lyman Field, Robertson, Ind.

Offers YOU...

reached, and engineers consider 740 miles an hour a possibility within present-day knowledge.

On July 25, 1909, Louis Bleriot in a little twenty-five horsepower monoplane first flew the English channel—a flight of less than twenty-five miles that required thirty-seven minutes. Who at that time would have believed that in 1932 great air transports would be regularly carrying passengers, mail and express 163,689 plane miles daily over 51,455 miles of airways in America alone?

So the warning is clear—prepare for the age of marvels. Not in thirty or in fifty years—but next year, and the year following, and in five years. Who will accomplish flights so far-reaching and tremendous that by comparison the exploits of Lindbergh, Byrd, Doolittle, Gatty and our other present heroes will be looked upon as we now look upon Orville Wright's first twelve-second sputtering leap into the air?

Glorious things await the young man contemplating an aviation career today. The newer crop of pilots coming up will be smarter than the present one. They will have to know more. And the youths of today who learn the allied sciences connected with piloting airplanes will get ahead of those who become mere pilots.

The time is rapidly coming when nearly everybody who wants to fly a plane will

Instructor Pointing Out Landmarks from the Air So Landings Can Be Gauged

Instructor Giving Pupil Final Instructions Before He Takes Off for First Solo Flight

Q2165

invented an airplane throttle control which may be operated with the same hand that a pilot flies with. The throttle is attached to the control stick. This boy's invention is being used by at least one commercial airline on service test.

If the present rate of airline extension is kept up, this country will be covered with a network of airlines by the time the present youth of ten years of age is old enough to get a pilot's license. The long trunk lines connecting distant cities or countries will require steady replacements as they grow. And the short feeder lines will need a vast number of pilots.

Of the two million workers connected with railroads, only a few are locomotive engineers. In aviation, however, there will always be a greater proportion of the men in the industry piloting aircraft. Most of the big men in aviation in the future will step up from pilot jobs to exec-

Section of Apron Serving Air Mail, Passenger, and School of Aviation Planes

be able to do so. They are making planes so safe and fool-proof almost anybody can pilot them. Physical disability of certain kinds is no longer a bar to pilot's license. The department of commerce has lifted certain defective-vision restrictions on about 5,000 cases. It was realized that if pilots wore corrective lenses in their goggles they could see well enough to fly safely.

*A crippled boy who has just started in high school at Norfolk, Va., has recently

Air College, Lambert Airport, St. Louis, Mo.

Class of Ground Students and Pilots at a Lecture on Engine Installation; Information Received Here Is Put in Practice in the Shop

utive positions as they have done today. It will always be an asset for a man in aviation work to be a pilot. But this is not absolutely necessary today and will not be necessary in the future.

Aviation is now a business. The more education the pilot of the future possesses, the farther he will go. But the time to start is now, and the future is entirely up to you. One of the best bits of advice that can be given a young man who wants to make aviation his career is to study foreign languages along with his other school work. The United States has already started airlines in Central America where Spanish is spoken, and in South America where both Spanish and Portuguese are used. There has been much demand for pilots, traffic managers, salesmen, airdrome managers and supply clerks

who could speak Spanish. They were and are now needed in the Latin American countries. Men with these qualifications will be in greater demand as the big airlines in those countries branch out.

With the breaking of so many flight records within the past year or so, many get the idea that there is little left for anyone else to do. But

Class Being Taught Wing Aligning, at Top, and Adjustment of Master Rod Bearing of Radial Engine, Below

these records simply widen the gap between themselves and regular everyday flying, and somebody must do a lot of work to bridge this gap. And bridges are not built in a day or even a year. It may take ten years for the highest-speed passenger plane to attain the highest speed of the racing planes as they now stand. And by that time some other records will be set up which will make the gap as wide as it is today.

It is to the young men of today who are experimenting and earnestly studying avi-

ation that flying must look for its future. The day of invention is not ended in aviation. Here is a wide open field for young men. Engines, fuels, instruments, methods of bracing, landing gears, wings, propellers, and nearly every other factor of flying will admit improvement through invention or refinement. Nobody yet knows why a bird can spread its wings and sail steadily against the wind.

Every advance of civilization has been inseparably linked to transportation. Aviation provides the fastest way of getting from one place to another. Its development involves every other science from chemistry to meteorology and every form of business training—a future, therefore, of limitless possibilities.

■ A buffalo census has been taken by airplanes in Canada; the black moving masses against the snowy ground made excellent pictures for the cameramen.

Ball Bearings in Galley Show Roman Skill

Ball bearings, usually considered an essentially modern development, have been discovered on one of the barges of Caligula, which is now being restored after lying nineteen centuries at the bottom of Lake Nemi. Two of the galleys were sunk in the lake and the other now is just visible, in thirty feet of water. A piece of wood from what was evidently a rotating platform has two of the ball bearings in place. The wood is part of what was a disk, with holes in its underside, in which the balls rotated. The spheres were cast of bronze, and shafts, or trunnions, were integral with them. The trunnions were held in place by strips of bronze nailed over the sockets. This disk revolved about a pin-tle set in a facing disk, and the weight was thus transferred to the trunnions, the ancient Roman engineers not understanding the principle of the free-rolling ball as applied in modern practice.

LOSS OF ELECTRICITY REDUCED BY LOW TEMPERATURES

Losses of electrical energy may be reduced if engineers find a way to apply the discovery that metal conductors reach the highest point of efficiency at temperatures hundreds of degrees below zero. The conductors must be made of an alloy which has been found a superlatively good conductor when subjected to intense cold.

DECAY OF TEETH NOW TRACED
TO DEFICIENT SOILS

a 2465

Tooth decay is caused, in a large measure, by foodstuffs grown on soil deficient in mineral salts, scientists agree. Exhibits at a recent meeting of dentists in New York showed that even a slight deficiency in vitamin C in the diet, while without apparent effect on the body, has a definite effect on the pulps of the teeth within twenty-four hours. Scientists say that there can be great variation in the value of milk, fresh fruits and vegetables to the general health and to the teeth. Oranges grown on the wrong soil, or picked too green, may be useless because they do not contain the needed mineral salts.

WINDOW MUFFLER BARS NOISE
BUT AIDS VENTILATION

1125 Little Bldg

Standard mufflers for sliding sash windows that let air in the room, but keep out a great part of the traffic noise, now are available in three styles. Inner reflectors are of curved plate glass or metal, hooking, or being fastened by bayonet joints, into the sills. For wide windows, the reflectors are furnished in two sections. The outside reflector is flat plate glass or metal, finished to match the exterior trim. The

ELECTRIC TIME-DELAY SWITCH
WORKS LIKE HOURGLASS

a 2474

Operating much like an hourglass, a time-delay switch has been placed on the market which, in its present form, allows delayed settings between two and twenty seconds. The principle of its operation is the movement of mercury from one receptacle to another. When the switch is thrown the mercury runs from one cavity into the other and, as the second chamber fills to the level of various wire contacts, the circuits are completed. The wires are tapped into the second chamber at certain timed points, and by changing the size of the metering orifice, an additional adjustment in the switch timing is obtained.

principle to give an accurate indication of height above the ground in fog or darkness. By means of an electric engine-temperature indicator and selector switch, the pilot can determine the head temperature of any cylinder at any time. Other electrical devices include a magneto compass, card compass, drift indicator, turn indicator, tachometer, oil-temperature and pressure indicator, voltmeter, control

Traveling showrooms now are being operated by two organizations, one to sell radios and refrigerators and the other glassware. Large trailers with fabric bodies are attached by swivel to a roadster or coupe. The employment of the trailer does away with the transporting of trunks, hiring sample rooms and arranging and dismantling displays, as well as the necessity of prevailing upon buyers to visit the display room.

ELECTRICITY HELPS FLY PLANE BY OPERATING INSTRUMENTS

Electricity is taking over much of the work of the pilot in flying an airplane. In a cabin monoplane recently built for the General Electric company, all the instruments except two, and a clock, are electrically operated, and the ship is to be equipped also with automatic steering, a device enabling the pilot to set the controls on a predetermined course and allow the ship to fly itself. For receiving weather reports and making contacts with radio range beacons and broadcasting stations, there is to be a system of synchronized radio apparatus. The a sonic altimeter supplements radio and instrument indications, operating on the sound-echo

pulleys, wing-edge landing lights, and an oil immersion heater.

HALO AND RAINBOW ARE SEEN IN BOTH DAY AND NIGHT

Confusion often is caused by the terms halo and rainbow, and many believe the difference is that the halo appears at night and the rainbow in the day. Actually, either may be seen both by day and night, if atmospheric conditions are right. The halo is due to the presence in the atmosphere of ice crystals, while the rainbow is caused by the refraction of light through water drops. The most common halo is a ring surrounding the sun or moon and may be highly colored in the daytime, while usually the lunar halo is so faint that the colors are almost imperceptible. A common form of halo is known as the "sun dog." The rainbow, on the other hand, instead of surrounding the illuminating body, lies in the opposite direction. As there are many types of halos, so also are there many forms of rainbows, even the fog bow, which is white or nearly so, being classed as one.

ACTUAL HEIGHT ABOVE GROUND
SHOWN BY ALTIMETER

Actual height above the ground over which the plane is passing, instead of the distance above sea level, is shown by a new height gauge completed by a Vienna inventor. Pilots flying at night and through fogs have complained about the previous type of instrument, which gave no warning when obstructions, such as mountains, were in the offing. The instrument operates on the principle that the farther away a body is from the earth, the lighter it becomes. The differences are so slight, of course, that amplification is necessary, and this is accomplished mechanically. In tests, the new altimeter detected even the differences between forest and clearing, while any abrupt rocks or other upward or downward formations were shown without appreciable lag.

FLASHLIGHT AND KEY WALLET
ARE COMBINED IN ONE

Combining flashlight and key container in one wallet, users are sure of finding the keyhole in the dark with the new "key-lite." The holder comes in all colors and styles of leather, the leather being sewed around a tubular flashlight, at one side. Hooks are attached to the top of the leather, on which keys are hung. The flashlight is the same size as the penlights so much in vogue, and batteries are easily obtainable.

The Keyhole Is Easy to Find with Combination Light and Key Wallet

Electric Horse That Gallops at Four Speeds When a Coin Is Deposited in a Slot

COIN-IN-SLOT ELECTRIC HORSES
RUN AT FOUR SPEEDS

Sport for children is provided by an electric horse that runs when a coin is dropped in it, and develops four speeds to suit the fancy of the rider. There are four drivewheels in the base on which the horse stands, and these are engaged according to the pull exerted on the reins.

AIR LINE INTO LAKE SAVES FISH
FROM DYING UNDER ICE

Fish are being saved from suffocation under the ice by oxygen forced into the water by an air compressor. A small portable engine pumps the air through an ordinary gas pipe and a nozzle frozen into the ice, but projecting into the water below. A depth of three feet of water beneath the lake ice is necessary for the equipment to operate successfully, since the pump is incapable of distributing the air properly. An area as large as 200 yards square can be treated to the point where the fish will not suffocate. In addition, air forced under the ice frequently opens up seams in the ice, permitting natural aeration. The plan has been used by the Iowa fish and game department.

GERMS IN EARTH MAY CHANGE TEXTBOOKS ABOUT COAL

Microscopic germs working more than 3,000 feet deep in the earth, probably will revise those parts of the school boys' textbooks that tell how coal was formed. Dr. Franz Fischer, director of the Kaiser Wilhelm Institute for coal research in Berlin, speaking at a recent conference in Pittsburgh, declared the old belief that coal was formed by the decay of ancient plants which first turned to peat, then brown coal, then bituminous and finally to anthracite was only partly correct. Doctor Fischer's re-

important part of germs in the production and control of coal and its products is receiving much attention, recent experiments having shown that certain bacteria can take the poison elements out of illuminating gas and turn carbon monoxide and hydrogen into methane.

Q 2338

SLED WITH WINGS LIKE PLANE

Shaped like an airplane, a coaster with wings offers many thrills for boys, for it is easily converted into a scooter by adding wheels when the snow and ice disappear. The sled has only one main runner on which a frame resembling the contour of an airplane body is mounted. At the front is a movable wing with auxiliary runners at each side. The main runner is two and one-half inches deeper than the side runners, the latter being used principally for steering and making turns. When used as a scooter, wheels are attached to the side runners and to the tail. The balancing feature of the main runner gives the rider more speed and thrills, but the coaster is under control at all times, since it is virtually impossible to turn it over because of the side runners. Short ski jumps can also be made with the sled, the rider standing upright and controlling the coaster by means of a rope attached to the wing tips.

Trying to Blow Up an Iceberg with a Huge Charge of T.N.T.: Observers Said the Result Was About the Same as Shooting a Rifle Bullet into the Side of a Big Bouldier

BESET by terrific gales, threading a precarious passage between scores of floating ice mountains and groping her way through dense fogs, the 125-foot coast-guard patrol boat, "General Green," last summer made her way through Davis strait and into Baffin bay, to the very birthplace of the icebergs, returning with new information and reliable data of utmost importance in the latest plan for reducing the iceberg menace in the steamship lanes.

It is with the hope of bettering the splendid service of the iceberg patrol that the birthplace of the bergs has been invaded. Eventually it is hoped there will be sufficient data to enable prediction well in advance of the number of bergs to be expected, the places where they will invade the steamer lanes and the course they will take. To arrive at this end, the iceberg experts are going right back to the source of the ice mountains to learn what conditions foster a great "calving" of bergs by glaciers and what conditions determine the route taken by them in their long journey south, where they become a menace to shipping.

The world holds few more awe-inspiring spectacles than the movement of icebergs out of Jacobshavn fjord, into Disko bay, on the west coast of Greenland. Jacobshavn glacier is the world's greatest mother of icebergs, the experts claim. The coast guardsmen have found twenty-two major glaciers contributing to the majestic procession that sweeps down on the steamship lanes. The contribution of Jacobshavn glacier leads all the rest. On the average, it calves more than 1,350 bergs each year. The Jacobshavn fjord is a giant trough in the solid rock, four miles wide and running back inland fifteen miles, between high precipitous walls, to the front of the glacier. When the investigators ran the prow of their little craft into the mouth of the fjord, they were met by an impassable wall of bergs.

The hunters made their way afoot to the top of the rocky bank. As far as eye could see in the fjord, icebergs were packed tightly, row on row, a breath-taking aggregation of white pinnacles and domes. They estimated that the great rock-walled trough held between 4,000 and 6,000 bergs. Those bergs, they decid-

1921

fractures ear drums. Suddenly the ghostly procession takes on momentum. At first the onward surge is barely perceptible, but the pace increases minute by minute, until the bergs are careening along at five to eight miles an hour.

When they will start and what starts them are as yet unfathomed mysteries. The experts are inclined to believe that an accumulation of water, caused by the melting of the surface of the glacier, gathers in sufficient weight to sweep

Top, a Great Glacier Moving Down into Baffin Bay; Below, Coast-Guard Cutter at Berg-Blocked Entrance to a Bay in the Arctic

ed would average about 7,000,000 tons of ice each, or upward of 30,000,000,000 tons of ice in that one fjord.

The movement of the bergs is not a steady march. Most of the year, they lie there, packing in tighter and tighter. About once a month they move. There comes a cracking and roaring, at first low and then swelling to a volume that nearly

the bergs forward. Another theory is that the bergs become solidly jammed against the face of the glacier, whose forward movement is passed on to them.

This is one of the problems that the coast guardsmen wish to solve. If they can ascertain just the conditions that cause the discharge of bergs into Disko bay, it will be an important point in pre-

dicting the number that will reach the steamer lanes at any particular time.

The investigators have learned that the birth of an iceberg occurs in a manner far different from the popular conception. It was long believed that the bergs simply broke away from the front of the glacier by sheer weight. It is true that a few small bergs are formed in this manner, but not the big fellows. Coming down its steep bed, the front of the glacier runs deeper and deeper into the water of the fjord. As the bulk beneath the surface increases in relation to the weight above, its natural buoyancy creates a great upward push. Finally, this push becomes greater

than the strength of the ice mass. Then the glacier front fractures at the bottom and breaks away from the main body.

There has long been a belief that stresses within the large bergs are such that a slight shock will knock them to bits. Experiences of the patrolmen have proved this theory a fallacy. They have peppered all sorts and sizes of bergs with explosive shells and discharged great masses of T.N.T. against them, but have not succeeded in shortening the life of any berg by a single week.

The slow-burning explosive, thermite, seems to have some possibilities. A charge of 100 pounds was placed to a depth of three feet in the top of a flat berg and ignited. Parts of the ice disintegrated, and, when the berg was revisited some hours later, about 400 feet of it had disappeared.

LIFE-SIZE MOVIES FOR HOME WITH NOVEL PROJECTOR

Life-size moving pictures of theater quality now can be enjoyed in the home with the aid of a new amateur projector.

Life-Size Movies Are Available for the Home with a Projector Embodying Many Features of the Commercial Theater Machine

The brilliance is obtained by an improved 375-watt lamp, a new lens, condenser, larger reflector and different reflector adjustment. A light trap also is provided to prevent stray illumination. The projector is entirely gear-driven. The rewind is automatic, and a pilot light has been built in that turns off when the projector lamp is switched on, and vice versa. Controls are provided for reversing or stopping.

DOOR LOCK WITH BELL ALARM GUARDS AGAINST BURGLARS

Protection against burglars is provided by a combination door lock and alarm now on the market. A chain connects the

bell alarm with the locking device, and the slightest pressure on the door starts the bell ringing. The chain may be

lengthened to allow the door to be opened a few inches so that one may see and talk to a visitor without admitting him.

Better Heat from Cheaper Coal with Blower.

Electric Blower for the Furnace Which Creates Forced Draft and Enables Use of Cheaper Coal

Score another worthy triumph for American heating and ventilating engineers whose research has developed inexpensive electric blowers which are efficient in providing a forced draft in your heating plant and which will reduce your annual coal bill from one-third to one-half or more where properly used. This new heating-plant accessory is particularly valuable in that it facilitates the use of the cheaper grades of anthracite coal, such as buckwheat, rice and barley, which sell for from one-half to three-fifths of the price of the best grade. These electric blowers are adaptable for use on all types of hot-air and pipeless furnaces as well as on hot-water or steam-heating plants. They are easy to install, simple to operate and require no more electric current than an ordinary reading lamp. The cost of operating the blower is less than 50 cents per ton of coal burned. A thermostatic control shuts off the blower automatically, the heavy bed of ashes prevents natural draft, and the fire, so to say, takes a nap for the time being until room temperature again falls below the desired degree when the blower goes into action and spurs the fire to increased vigor. While elaborate and expensive types of electric blowers are on the market, the

motor and fan of an old forge may be used for the purpose. It is a simple matter to install one of these blowers as an important adjunct to the furnace or heating plant when first erected. The customary procedure is to cut an opening into the ash pit and to hook up the forced-draft mechanism to that aperture by use of a gal-

vanized metal duct and a short piece of rubber tube. If the blower equipment is added after the furnace is completed, it is sometimes necessary to remove the furnace casing—particularly in the case of hot-air furnaces—before an opening can be cut into the ash pit. The best results in burning buckwheat, rice or barley-size anthracite coal where an electric blower is used are obtained by keeping the live fire highest at the coal door and the green unburned coal slightly lower and at the rear of the fire box where the blower is attached to the ash-pit door. The electric blower can be operated successfully either under hand or automatic control. Under the manual method of operation, the blower is turned on and off in the same way as the average home fireman adjusts the draft damper by means of the usual chains. The draft damper at the ash door is kept shut and retired from service. The only damper which remains to be adjusted is the one in the smoke flue. It should be

Q2324 Introduced by

POPULAR MECHANICS

SUN GLASSES COVER THE NOSE
AND PREVENT BURNS

opened when the blower is not in use, as a safeguard against overheating, just after the blower is shut off. A number of different installations are possible under automatic control where the electric blower is attached to a thermostat. Frequently, the thermostat is yoked to operate both the check draft in the smokestack and the air-blast check gate at the discharge end of the blower. Do not close the damper in the smoke pipe if you use an electric blower. It should be half open at least to let out the carbon-monoxide gas.

GOATS REDUCE COST OF MILK AND MAKE A PROFIT

Goats as a source of milk supply for the suburbanite or resident of the smaller city will reduce cost as well as furnish a food considered so easily digestible that it often is fed delicate infants. Even where all the fodder is purchased, the cost for a 135-pound milch doe is only about five cents a day, and two of the animals will produce from four to eight quarts of milk every twenty-four hours. Where the goats are maintained under absolute sanitary conditions and fresh, wholesome feed is given them, the milk has neither objectionable odor nor flavor. Any milk produced over and above the immediate needs usually finds a ready and profitable market in the feeding of neighborhood babies. An elevated table, which includes a seat for the milker, recently has been developed and makes the milking a simple task.

Elevated Table That Makes the Milking of Goats a Simple and Sanitary Matter

Nose Guard for Sun Glasses Keeps Tender Skin from Becoming Sunburned or Freckled

Tender noses may now be protected from sunburn by the same glasses that prevent eye strain on the links, polo field or beach during the fashionable winter season. The odd-appearing pair of colored spectacles has a nosepiece that matches the rim and covers the nose.

FOOD IS CHANGED TO POWER IN DUST MOTORS

Explosions of coal dust, often the cause of great disasters, give promise of becoming one of the chief power sources of the world, according to Rudolph Pawlikowski of Germany. Ignitionless, Diesel-type internal-combustion engines have been run thousands of hours and produce a kilowatt-hour for about twenty-six per cent less than the steam turbine. Italian sanz-a, a meal made of the residue left from the manufacture of olive oil, and ground-up wood has operated the motor just as well as coal dust. Cheap vegetable powders for which there is little use, such as those from palm kernels, sunflower seed, rape, hemp, peanuts and soya beans, are recommended as good motor fuels. The dust motor is essentially a Diesel engine with the addition of an auxiliary chamber in which the fuel is prepared for admission to the cylinder head where it is compressed and exploded.

Here's Something to Think About:

How Much Do You Really See?

DRIVING at a good clip along a crowded highway, you are somewhat surprised when a green juggernaut of a car, without the slightest warning, flashes up alongside and is far out in front before you are aware of it. May be you wonder what would have happened if you had, a moment before, decided to pull over into that lane of traffic without a backward glance or a warning signal. But—and this is the peculiar part—a white car couldn't have done that.

Perhaps that requires an explanation. The normal individual, when looking straight ahead, sees clearly what is directly in front of him. This is central vision. At the same time, even though his eyes are fixed straight forward, he is aware of objects on either side, although they are not seen so clearly. This is peripheral vision. While different individuals possess varying fields of vision, the perception of light-colored objects is always simpler than of dark-colored objects. A white car, pulling up alongside, is visible in a protective sense at right angles to the central vision; a dark green car does not become

Interesting Tests Which Show the Field of Vision for Different Colors

visible to the same extent until it has almost reached a forty-five degree angle forward from your eyes.

Try this: Take a white and a green pencil. Hold the two in your left hand, the green pencil in advance of the white. Now, hold the pencils in position alongside your head and fix your eyes straight forward. Gradually bring the pencils to the front. Soon your eyes will tell you that your hand holds a white pencil, but the green one, even though it is in advance of the white, does not become visible to the same extent until the hand is carried farther forward.

In a similar manner, each color has its own field. As shown in the diagram at the bottom of page 248, the green field is very restricted, the red somewhat larger and the white largest of all. Driving the black car shown in the sketch, a white car, a blue car and a green car have to occupy the respective positions shown in order to be visible to the same extent. Of course, under actual driving conditions you vary a straight-ahead gaze with occasional glances to either side. This is as it should be. It is a common mistake with near-sighted persons to maintain a fixed focus, keeping the eyes constantly on a distant point. Far from making the vision better, this often tends to produce tem-

Above, Muscular-Balance Test; Center, Distortion Caused by Unbalanced Eye Muscles; Below, Reversed Muscle-Balance Test Which Shows Two Holes in Cardboard Instead of One

porary blindness over certain areas of the retina on either side of the fixing point. Black dots on a piece of cardboard will disappear and reappear in puzzling disorder if the eyes are concentrated for even a short time on any one dot. Looking at one dot and then another in quick succession allows you to see all of the dots with greater clearness. Fixing your eyes intently on a pencil held in the hands of another person, you cannot tell with any degree of certainty when another pencil, a few inches distant from the first, is brought to a position even with the first one. But by focusing your eyes on one pencil and then on the other, you can easily judge the distance and tell the person to move the pencil this way or that until you see that they are equidistant from your eyes.

Muscular balance of the eyes plays an important part in the distance-judging

test just described. Without perfect balance, the whole test "goes haywire." There are six little muscles that control the movements of each eye. They are so delicately balanced that they cause the eyes to act in unison to see but one object. When the eyes are not properly balanced, either you see double or else make a constant effort to maintain single vision. The necessary effort to attain single vision causes eye fatigue, headaches and the dancing black spots of partial blindness.

You can easily judge whether you have perfect ocular muscular balance by a very simple test. Take a small round bottle and paste a gummed label around it after first cutting out a portion of the label to form a narrow slot on opposite sides of the bottle. Fill the bottle with red liquid of any kind and cork it tightly. Now, with both eyes open and the slot in the label opposite the right eye, as shown in the top photographs on page 249, fix your

gaze on a candle flame or electric bulb at a distance of twenty feet. With the bottle held horizontally, you will see a vertical streak of red light. This streak should pass directly through the candle flame, as at B, if your eye muscles are perfectly balanced. Holding the bottle vertically, the streak should pass directly through the flame, as at A. If the streak is above or below in one position, or, to either side in the other position, your muscular balance is imperfect. In almost every case, a slight abnormality is revealed. When the deviation is so great that the eyes cannot overcome it, double vision, as indicated in the central photograph, results. Working the muscular-balance test in another manner, you will see double if your eyes are normal. Looking through a hole punched in a piece of black cardboard at a pencil or other object some distance beyond, you will see two holes in the card instead of one.

Demonstrating Wireless Light Capable of Illuminating Bulbs
Forty Feet Away or Quickly Cooking a Meal

WIRELESS LIGHTS UP A BULB FORTY FEET AWAY

Light from an ordinary electric bulb, without any wires connecting it to generator or power line, recently was demonstrated in the power-tube laboratory of the Westinghouse Electric and Manufacturing company. All that is necessary is for the bulb to be placed in the ultra-high-frequency field produced by a standing wave oscillator sending out 15,000 watts from an antenna. The power comes in the form of radio waves, three meters long and alternating 100 million times a

second. The tremendous power lights all lamp bulbs within forty feet, cooks food in a few seconds and raises body temperature one degree per minute, also causing exhilaration in the human subject if too long exposed.

GASOLINE CUTTING TORCH IS SAFER AND CHEAPER

Gasoline fuel is employed in a cutting torch just placed on the market that is said by its makers to reduce costs, promote safety for operators and save space in the shop. The torch is fitted with a self-generator that turns the gasoline into vapor, after which it is mixed with oxygen and ignited as in the usual type of oxyacetylene tool. Tests show that on

**BIRD REFUGES ON WASTE LAND
PLANNED BY U. S. BUREAU** *2402*

Bird sanctuaries will be built on waste land in every state, under plans of the U. S. bureau of biological survey of the department of agriculture. Thousands of acres of non-productive land will be used in this manner, while 1,796,000 acres already have been surveyed in the government's move to conserve wild life. Bird refuges and bag limits are the only means of preventing extinction of ducks, geese and other migratory birds. Six sanctuaries have been established, while nine more states have passed legislation allowing the government to establish preserves. Forty states now have such laws, with Arkansas, Idaho, New Hampshire, Pennsylvania, Tennessee, Utah, Vermont and Washington yet to join the movement.

**"BEEHIVE" PLACED IN FURNACE
CUTS COST OF FUEL** *22256*

Made of a refractory material that is guaranteed to stand 3,200 degrees of temperature without burning, a "beehive" fuel saver has been developed for the coal-burning furnace. Manufacturers of the device argue that the ordinary coal fire is

only about fifty per cent effective because sufficient oxygen never gets through the fuel bed to cause thorough combustion of the gases above the fuel level. The beehive saver is built in the shape of an inverted cone with vents in the sides through which the air can flow. Air is drawn upward into the cone, preheated there, and enters the combustion chamber at a temperature making quick ignition possible. This places enough oxygen above the fuel to ignite the smoky gases, which ordinarily would pass out unburned.

With This Truck One Man Can Handle the Largest Outboard Motor Alone

**HAND TRUCK FOR BOAT MOTORS
MAKES HANDLING EASY**

Outboard motors are handled easily by using a hand truck now on the market. A wedge-shaped board, to which the motor can be securely attached, is fastened on the handles of the truck, thus enabling one person to move the largest outboard without any difficulty.

**CLOCK HANGER ON WALL PLUG
KEEPS WIRES HIDDEN** *2263*

Combining with it a mechanical support for the electric clock, an electrical wall-outlet plate has just been developed that assures neat appearance. The plug cap is fitted with a metal hanger and is recessed so as to fit flush, allowing the clock to hang flat over the outlet with the connection and receptacle fully concealed.

How to Avoid the Tricks of the Pickpockets

Upper-Left Photo Illustrates How a Pickpocket and His Confederate Operate; Right, Dummy on Which Pickpocket Practices; Lower Left, the Obliging Victim Is Being Robbed; Right, Lifting a Ring

Whenever you are in a crowd where pushing and jostling is likely to pass unnoticed, you become a potential prey for the pickpocket, and you can best thwart this type of thief by recognizing his methods and being on the lookout for them. To ply his trade successfully, the pickpocket must not only have agile fingers, but he must maneuver you into a position where you are likely to be unsuspecting of his actions. Pickpockets often work alone, but usually they operate in pairs. On a jammed street car or elevated train, for instance, one of them may spread a

newspaper in such a way as to hide his hands as he lifts your watch from a vest pocket. Once he has the timepiece, he passes it immediately to a confederate standing at his elbow, so that even if you were to miss the watch and suspect him because of his proximity, you would not find it on him. It is also well to beware of the stranger who asks for a match and then allows you to hold it for him while he bends for a light. While your interest is centered on holding the match to his cigaret, the pickpocket's interest may be concentrated on a watch or purse in your

coat or vest. Undue jostling in a crowd is likewise to be viewed with suspicion. One pickpocket may distract your attention with a push while his companion extracts your purse as you glare at his confederate. Some pickpockets undergo a strenuous period of practice with a dummy on which they try their skill after fitting it with a system of bells which ring if they make a false move. A variation of the pickpocket's game is to enter a jewelry shop and ask to see watches and rings. After inducing the salesman to bring out several items, the thief pretends interest in one piece, attracting the salesman's attention to this while withdrawing a more valuable item from the display.

CLOTHES CONTAINER FOR AUTO ATTACHES TO ROOF OF CAR

Clothing can be kept fresh and unwrinkled while on an auto trip by placing it in a bag that holds more than a large suitcase and is attached to the roof of the car where it is out of the way and takes up little needed space. The bag has hangers at each end and can be removed from the car or left packed for any period of time without damage to its contents. For easy handling, it can be folded to half its size. All openings are fitted with hookless fasteners, and any article can be removed without disturbing others. The container attaches to eyes placed at front and rear inside the body, and is held firmly in place by a turnbuckle adjustment, three rods passing under it to give support. Only a few minutes are needed to install the fixtures.

Large Clothing Bag That Keeps Suits in Press and Is Attached to the Roof of the Car

Blueprints Can Be Filed Vertically for Reference, or Easily Removed if Needed; Each Holder Has a Capacity of 200 Sheets

BLUEPRINTS FILED VERTICALLY ON SWINGING HOLDERS

Vertical filing of large sheets, such as blueprints, tracings and maps, now is possible with the introduction of holders which swing out when the blueprint is desired. The units are interchangeable so that it is possible to start the file with a single holder, with capacity of 200 sheets, and to build up to indefinite limits merely by adding more units. The holders are made for all sizes of sheets and can be placed on walls, tables, in cabinets or closets. Sheets are attached to a holder by punching or gumming to punched strips. Sliding keepers lock the paper-fastener prongs, enabling speedy removal or addition of sheets. The holders slide on a track formed by hanger arms which are swiveled to allow swinging out for inspection or removal of prints.

Placing Valve Tips in a Hardening Machine Which Is Controlled by an Electric Eye

ELECTRIC EYE HELPS HARDEN STEEL FOR VALVES

By recognizing various color changes in steel during heat treatment, a photo-electric cell has been made to regulate the tip hardening of valves. A valve is placed in the hardening machine and electric current is passed through the tip. When the tip is at the proper heat, the cell shuts off the current and drops the valve into a quenching bath.

DRIP FROM SCHOOL INK BOTTLE IS STOPPED BY SIPHON

Waste of school ink is eliminated by a glass container with a dripless siphon now on the market. The siphon provides a steady flow of ink from the container to the individual bottle as long as the bulb is squeezed, but stops the flow instantly when the operator's finger is removed from an air vent in the siphon.

HOW TO FIND THE STRENGTH OF A ROPE

Every one uses rope, which in its broadest sense includes all kinds of string, twine and cable. So, the industrious housewife, as she balls up the odd bits of various sorts of string becomes a co-worker with the boatswain of the mighty battleship as he lays out his great hawsers, more than 900 feet in length. Both are working with the one thing that has made it possible for man to triumph over and become master of the animal world, for without that little spark of genius which first recognized the power that lay within the crude bits of forest string—small vines—the world might yet be in the dark ages of countless centuries ago. Rope is made of the vegetable fiber of plants and ranges in size from the finest thread to the large manila hawsers, fifteen inches in circumference, strong enough to lift a weight of more than sixty tons before it breaks. However, very little rope of this size is used, since a wire rope, two inches in diameter, has a breaking strength of over 140 tons. Manila rope leads in all qualities except strength; hemp, or white rope as it is sometimes called, being somewhat the stronger. Manila is smoother, more pliant and offers greater resistance to decay due to the fact that it absorbs very little water in comparison with hemp. To find the strength of a piece of rope, open up the end and count the threads which you will find to be six, nine, twelve, fifteen, and so on. For each thread the rope will lift 100 pounds, but if you want it to last a reasonable time, from fifteen to twenty pounds to the thread is correct. For larger size rope, its circumference squared and multiplied by 150 gives its working load in pounds. There are other ways of arriving at the same thing by a more complicated calculation, but the above method is sufficiently accurate. Rope deteriorates rapidly if stowed away wet or in a damp place, or if exposed continuously to heat.—John Donald Thompson, Chief Boatswain, U. S. Navy.

Fake Radio Truck Bluffs Unlicensed Fans

In England, where the owners of radio sets are required to pay for licenses to receive broadcasts, so many attempts were made to evade this regulation that the British authorities recently launched a campaign against unlicensed listeners. A truck, fitted with a formidable array of instruments and a shiny swivel aerial on the roof, was hauled through the streets, making frequent stops while a crew of men twirled the dials and twisted the aerial. Frightened by the activities of these radio

Views of Radio Truck Containing Fake Apparatus Which Frightened British Listeners into Buying Licenses, and One of the Investigators

sleuths, 80,000 persons who had been using receivers without licenses hurried to obtain them. At the close of the campaign, the London Express told that the truck was a fake and could detect nothing. The hoax was intended only to scare set owners to buy their licenses.

COAL USEFUL AS A FERTILIZER TO STIMULATE PLANTS

Coal in small doses may find wide use as a fertilizer because it exerts a stimulating action on plants, causing them to in-

crease their yield by more than one-fourth. This is the conclusion of Dr. Franz Fischer, German authority on coal and its uses, who increased the yield of tobacco plants by using dissolved brown coal as a fertilizer. Scientists cannot account for this stimulating action as they have discounted the possibility that the coal might be a source of carbon and the suggestion that mineral substances in the coal might act as fertilizers. While pulverized brown coal may speed up plant growth, subsoil strata of brown coal retard growth, it was found.

Base for Cradle-Type Telephone; It May Be Mounted on Wall or Set on Table

COMPACT CRADLE-PHONE BASE FOR WALL OR TABLE

Cradle telephones may be placed on walls where they are out of the way by the use of a holder containing recesses for the mouth and earpieces. The switch is so arranged that the weight of the phone will open the circuit whether it is in a vertical or horizontal position, so the holder is suitable for table use too.

AIR "BOMBS" MAY HATCH CHICKS IN TWENTY-FOUR HOURS

Poultry farmers of the future may be able to hatch chickens in twenty-four hours instead of twenty-one days by using an air "bomb," or compressor cylinder, instead of an incubator. This is the prediction of gas experts of the Imperial College of Science, London, who took a leaf out of the book of daily experiences of deep-sea divers to aid them in hatching eggs. Divers in deep water work under a high air pressure, equivalent to that of the water above them, compressors forcing air down to them from the surface. In the process of working under water, the diver's blood becomes impregnated with bubbles of nitrogen gas, so he ascends gradually to get rid of the nitrogen, or else decompression takes place in a chamber above, at safely graduated periods. The divers' experiences suggested to a biologist that eggs might be hatched more

quickly if submitted to similar conditions. Experimenters first tested frog spawn by placing it in a steel cylinder at a pressure about fifty-two times as high as normal atmospheric pressure. This was maintained for twenty-four hours at a temperature normally required for hatching the eggs. When the tadpoles hatched, they were placed in water to "decompress" them, and, while injured by this rough and ready method, they managed to live three days. Next a dozen hen's eggs were placed in a steel compressor at a temperature of forty degrees, and the air pressure was raised to one ton per square inch. It was expected that the egg shells would collapse, but strangely enough, they did not, the shells apparently having been porous enough to allow a percolation of air through them to equalize pressures. This method was found to speed up hatching, but, as in the case with the diver, a method of "deflating" the chicks was necessary. This was accomplished in a special type of decompression chamber.

MAP STANDS FOR LARGE PARKS AID VISITING TOURISTS

Large parks in strange cities often cause tourists difficulty because they are unable to find their way about, but Rock Creek park in Washington, D. C., has solved this problem by installing big outdoor maps directing visitors to the points of interest. These maps are placed in frames under glass and rest on rustic stands. Strangers consult the maps when confused instead of inquiring of park officials.

MAGIC *for* EVERYBODY

IN the whole field of conjuring, there is no more popular division than impromptu magic. And small wonder. Not only do these tricks require no previous preparation or special apparatus, but the actual workings of the effects are usually quite simple—an important consideration to that vast army of would-be entertainers with little time for practice.

Try this: Take an ordinary kitchen match and cut off the business end, leaving about one-eighth inch of wood. Remove the drawer from a penny box of matches. Put the cover on a table. Put the match head on the cover. Now, holding the drawer, open side down, in your right hand, you can very easily brush the match head off the cover and onto the table, imprisoning the head under the box. In performing the stunt, you go through this movement twice, but the third time you lift the drawer to show the match head—and the thing isn't there. Vanished completely. All because, in sliding the match head off the box, you allowed a

Above, Using a Matchbox to Make a Match Head Vanish; Below, Tearing a Double Thickness of Cellophane

tiny bit of the wood to project beyond the drawer. The result is that the match does a fancy somersault backward through the cover, ending up in the palm of your hand or in your lap.

If you are a cigaret or cigar smoker, you have probably noticed long before this that the new cellophane wrapping is an exceedingly tough fabric. Double a piece and try to tear it. Hand it to the strong man of your crowd and acquaint him with the general idea. May be he'll tear it; may be he won't. At any rate, he should register great surprise when you gently tear the tissue with effortless ease. And how do you do it? Simple! You prepare for the demonstration by punching a few holes in the cellophane with a pin. On removing the wrapping from the pack, you tear the cellophane (quite simple with a single thickness) and hand the unprepared half to a spectator with the request that he double it and try to tear it in half. While he is busy doing this, you casually crease your half of the paper so that the fold comes directly on one of the pinholes. And there you are! Tearing at the pinhole, the thing fairly melts away.

Here's one with cards: The performer fans the deck and requests a spectator to take a small bunch of cards, not over ten, from the center of the deck. The spectator is to count these cards, note the card

on the bottom and then place his packet on top of the rest of the deck, which is held by the performer. The latter does not know how many cards were taken, nor the bottom card of the packet, yet, after counting out a number of cards on the table, he instantly turns over a card which shows the number of cards taken and then turns over another card which proves to be the one selected. But it's so very simple. Starting out, you have a series of cards from ace to tenspot arranged on top of the deck. Now, regardless of how many cards the spectator takes, the eleventh card will always show (by the number of pips) how many cards were taken. Thus, in the illustration on this page, the spectator has added five cards to the top of the pack; and the eleventh card shows a fivespot. If he had added six, the eleventh card would be the sixspot, and so on. Does that clear it up? You simply count out about eighteen cards on the table. Turning over the eleventh card, you immediately call out the number of cards taken, and then, knowing the number taken, you can easily count from the beginning of the row and turn up the selected card.

By Having a Series of Cards from One to Ten on Top of the Deck, the Performer Can Easily Tell the Number of Cards Removed by a Spectator and Name the Bottom Card

9 1912

Drawings in This Column and in Center Show How a Loop of String Is Made to Slip off Spectator's Finger by a Few Moves

At Top of Page Is a Trick with Three Water Glasses That Looks Easy When the Spectator Sees It, but Is Not So Simple When Tried

Removing Loop of String within Another Loop; Below, Why You Can't Make a Six Like the One on Your Watch

An Easy Coin Trick: the Dime Drops from under a Handkerchief into the Trousers Cuff

For some real fun, try turning the tumblers. Like this: The performer arranges three tumblers on the table, placing two upside down and the third upright. The big thing is to make exactly three moves, turning over two tumblers at each move, and on completion of the round have all the tumblers mouth up. The performer does it easily, but the spectator fails every time. Why? Consider the illustration on page 261. Notice that the top row of glasses are arranged with the end tumblers mouth down and the center tumbler mouth up. From this position, you can turn all of the tumblers mouth up in exactly three moves by turning No. 1 and 2, then No. 1 and 3, and then No. 1 and 2 again.

There you are. Turning over the center tumbler and leaving the end ones upright, you invite a spectator to try it, but even if he were to repeat your moves exactly, the thing would be impossible. By watching your chances and stepping in whenever the tumblers are in the correct position, you can keep the fun going for some time.

Here's a loop that won't stay put. You loop it over a spectator's finger; you make a little twist or two, and, presto! it's off again. (See the left-hand pictures on page 261.) Notice that the string has been looped over the spectator's finger, and

that the performer makes his first move by inserting his forefinger between the two strings, pulling the far string over the near one. Next, the hand is turned over to allow the thumb to enter the loop next to the spectator's finger. The rest really doesn't matter. If you will make these two moves and then place your forefinger on top of the spectator's forefinger, you will find that the mere action of disengaging the thumb will cause the loop to come free, as in the center photo.

A good stunt to follow the loop trick is shown in two of the right-hand pictures. You start by tying a small loop in a piece of string; then tie the ends of the string together with several good knots to prevent the small loop from getting away. But it does get away. After the spectators have given the thing up, the performer covers the string with a handkerchief, and, by simply pushing the single knot up to join the others, causes the small loop to vanish. And they call it magic!

Here's something worse: Tell your friend he is very unobserving. Tell him he has a watch which he has looked at a thousand times, yet you wager he does not know the style of the numerals. "Are they Arabic, script, Roman or what—I ask you. Here take this pencil. Try to draw a number, say the number '6,' like it is printed on your watch." Ho, hum! At any rate, you can readily appreciate that this is a very difficult stunt, for the average watch has no numeral "6," this space being taken up by the second-hand dial. But don't get the idea you knew that all the time. You didn't.

This is a good way to get rich. First of all, you borrow a dime. Then, you very nonchalantly ask the lender if he would pay a dime to see a really good trick. Yes? All right. Then you proceed to make the dime vanish. You place it on your knee. You cover it with a handkerchief. You draw the hanky tight to show that the dime is there. You grip the dime through the handkerchief and lift it up. You gently waft the hanky to and fro. You tell the spectator thanks for the dime. Of course, no decent spectator will ever suspect that you gently flipped the coin forward after covering it with the hanky, letting it slide down your trouser leg and into the cuff.

POPULAR MECHANICS

Wilmington, Del.
MOLD-KILLING SPRAY TO SAVE MILLIONS IN LUMBER

Sap stain or "blue stain" and mold, causing estimated annual losses of about \$10,000,000 through depreciation of air-dried lumber in storage, may now be prevented by a chemical-spray treatment for pine and certain hardwoods. The preventive has been tested in more than a hundred mills and has proved successful in maintaining the bright, natural appearance of pine, sap gum, black gum, yellow poplar, magnolia, and other woods. It may be applied by dipping, if preferable. The cost of treating average lumber is found to be about twelve cents per thousand board feet.

THIS SIGN BREAKS UP LETTERS AND REASSEMBLES THEM

Advertising signs in which the letters and words fly to pieces, and then reassemble to form the original message are being used in Europe, where the motion involved has been found to attract much attention. Such signs consist of boards with revolving disks, the letters or pictures being painted on the boards and disks while they are in one particular position. When the disks are made to revolve, the letters appear to fly to bits, but reassemble again when the disks return to their original positions.

The Letters on This Sign Fly to Pieces and Reassemble; the Figures Are on Revolving Disks

Electric Hot-Dog Cooker That Turns Out Hot Buns in About Two Minutes

ELECTRICITY COOKS "HOT DOGS" AND HEATS THE BUNS

Wiener sandwiches are heated ready to eat in less than two minutes by an electric cooker now being offered which prepares five "red-hots" at a time. The cooker consists of a metal tray with prongs on which the buns and meat are impaled, the wiener completing the circuit.

FEATHERS GET HUES FROM SUN BY REFLECTING LIGHT

To a considerable extent, the rainbow hues of the pheasant's feathers are rainbow colors in fact, for they are due largely to reflection of light from transparent substances in the feathers, just as the rainbow is due to reflected light from transparent raindrops. Dr. Stanley C. Ball, of the Peabody museum, Yale University, found the iridescence of such feathers is determined partly by the shape and position of the barbs, partly by the position of the light source, and partly by the position of the observer. This does not mean that feathers have no colors of their own. There are plenty of pigment bodies in parts of the feathers, but the real "show" of a bird's plumage is mostly a matter of reflected light.

Steel Backing for Brick Makes Better House

Grouting Mortar to Fill Wall Space. Left: Applying Insulation. Below, and Sketch of the Interior and Exterior Construction of the Wall

Steel reinforcing for brick-veneer construction that not only provides waterproofing, insulation, vermin and fire resistance, soundproofing and economy, but also employs only standard building methods and materials, now is available for the home builder. Ordinary brick-veneer construction leaves a space between the brick and the sheathing, which it is now believed, causes a draft, actually conducting heat or cold. In the new system, the wall is studding framework as usual, but on the outside of it a welded two-by-two-inch wire-mesh reinforcement with a heavy paper backing is nailed, replacing sheathing boards. The bricks are laid one inch away from the reinforcement, and the space is grouted with regular mortar as the brick are laid. The outside wall, when completed, then becomes a monolithic reinforced slab of brick and masonry. The reinforced wall is the same thickness as the ordinary one while the structural strength is greater and heat-resisting characteristics are considerably better. After the outside walls are finished, a mineral-wool insula-

tion may be placed from the inside by pressing it between the wood studding. Interior walls and ceilings then are lathed with two-inch wire-mesh paper-backed lath, a base and reinforcement for interior plaster. This interior construction not only eliminates all lath, joint and stud marks, retards sound, prevents infiltration of moisture and air and greatly reduces the tendency to crack, but adds strength. The entire home thus is wrapped in efficient insulation and incased in a network of steel wire, which takes up strains and stresses in every direction.

MOSQUITOES TRAVEL BY PLANE AND MENACE HEALTH

Mosquitoes hitch-hiking rides on airplanes from South America can bring the virus of yellow fever into this country, but the danger is small if the planes are treated to destroy their free passengers. This conclusion has been reached by the public health service which has made a study of mosquito transportation by plane.

low-Ground Cutting Surface on Any Blade

RUBBER BULBS USED AS "CUES" IN PUFF-BILLIARD GAME

Miniature Billiard Game Played with Rubber Bulbs
Which Blow Cork Balls about the Table

Rubber bulbs are used as cues and a small cork ball replaces the ivory ones in a miniature form of billiards. Puff-billiards is played on a circular table containing four pockets. There are four players and each manipulates one of the rubber bulbs attempting to keep the light cork ball from entering the pocket he is protecting. Score markers are mounted on the rim of the table.

LIVER CONSERVES BODY'S HEAT BY TAKING UP WATER (192)

At the onset of a fever or when the body is chilled, the liver saves heat by storing up water. This new function of the organ was discovered recently by Dr. Henry G. Barbour, of Yale University. The onset of fever, he explained, resembles the reaction of the body to cold, the shivering or chill producing extra heat which is saved by withdrawal of most of the surface circulation. When fever is produced, the blood becomes more concentrated and loses part of its water content, but at the same time the water content of the liver increases. Since the principal way in which the body loses heat and becomes cool is by evaporation of water, Doctor Barbour reasoned that the liver takes up the water lost by the blood at the start of fever, thus saving heat for the body by preventing its dissipation through water loss and evaporation.

With the

FIGHTING the bloodthirsty Chinese river pirates who recognize no man-made law and regard human life as a joke is one of the major jobs of Uncle Sam's Yangtze patrol. Six American gunboats travel daily back and forth along the 1,000 tortuous miles of the Yangtze between Nanking, capital of China, and Chungking, deep in the interior.

Sailors, policemen, detectives, protectors of the life and property of all nations—such are the Yankee bluejackets who work where romance beckons, death threatens always and action is demanded. Almost unbelievable in their cruelty and acceptance of medieval pirate methods are some of the recent acts of the river bandits, according to official records of our navy and state departments.

Plundering merchant ships of all nations of untold millions annually, forcing many of their victims to walk the plank, and holding others to ransom up to \$500,000 for a single individual, these ruthless pirates possess remark-

Above, Sketch of a Junk That Was Grounded in Search for Pirate Queen; Below, Taking Powder from a Magazine

Chinese Pirates

able cunning; so much so that in the past they have been almost impossible to identify, let alone catch or bring to justice. When some unfortunate vessel strikes a rock, whenever floods spread a virtual reign of terror for hundreds of miles, or treacherous currents or gorges make a boat well-nigh helpless, the river pirates plunge from their hidden retreats along the shore to pillage, despoil and murder.

Assuming that the victim vessel is fairly close to shore, the bandits will assemble some twenty or thirty men, armed with old pistols, rifles, cast-off cannon or even stolen machine guns. Whereupon their victims, helpless to offer resistance, must give in or die. Small wonder that the great powers, including the United States, Great Britain, France, Italy, China and Japan, maintain regular gunboat patrols along the river. During

Above, Sketch of Typical Chinese Pirates Boarding a Vessel to Loot and Kill; Below, Reefing Sail on the Yangtze River

the past year the merchant ships have suffered an almost unprecedented number of bandit attacks. As might well be expected, China and Japan lead the other nations in numerical strength of armed vessels along the Yangtze, with the United States and Great Britain competing for second place. However, no nation has

a 1940

more modern or more efficient equipment than our six regular gunboats and two "spares." When unusual emergencies arise, such as a devastating flood, or special pirate threat, these crack boats are augmented by destroyers from our Asiatic fleet.

Few Americans know that our Yangtze patrol was established as far back as 1870. Today it is a regular subdivision of the Asiatic fleet. Its base is at Shanghai, with sub-base at Hankow. The gunboats are under command of Rear Admiral Yancey S. Williams. During normal times, the patrol protects American missionaries and traders who have established their posts along the river, and escorts American ships traveling its course, or places armed men aboard them for protection from raids by bandits. Nor does the patrol limit itself to safeguarding American citizens and their property. Under special order of the United States government, our gunboats go unhesitatingly to the aid of others who may be threatened with outlaw attacks, for the patrol can go into

remote stretches of the mighty river into which no other units of our fleet can penetrate.

Again and again the vessels of the American fleet have aided the Chinese government in the maintenance of aids to navigation along the river. Bandits constantly are removing buoys and lights marking the channel, causing hundreds of commercial ships to ground upon dangerous shoals, where they are pirated easily.

All the patrol ships are flat-bottomed and have lately been equipped with bullet-proof steel. It has been found expedient to build the gunboats in three sizes, to fit them for duty on the three chief zones of the Yangtze. From Shanghai to Hankow, the river is open to navigation by ocean steamers for nine months of the year. From Hankow to Ichang, the river can be navigated only by smaller vessels. At Ichang, the treacherous gorges begin. Only especially constructed vessels can proceed up and down these rapids.

The two largest gunboats, the "Luzon"

American Bluejackets of the Yangtze River Patrol in China; These Yankee Sailors Constantly Patrol the River and Its Harbors to Protect Merchant Vessels from Pirates

and the "Mindanao," are about 198 feet long, of 500 tons' displacement, and have a speed of sixteen knots. They have been fitted for flagship accommodations. The two patrol ships of intermediate size, the "Oahu" and "Panay," are some 180 feet long, of 385 tons' displacement, with a speed of fifteen knots. The smallest two, the "Guam" and "Tutuila," vessels assigned to protect American interests in the gorges of the upper river, are about 150 feet long, of 350 tons' displacement, and a speed of fourteen and one-half knots. Each patrol ship carries forty to sixty men, three officials and one or two three-inch guns with some machine guns.

In traversing the gorges and rapids of the Yangtze, speed and immediate control are vital factors in safe navigation. The situation demands power combined with light draft in all ships. During the flood season, from May to November, the stream throughout its length tests the skill of the best seamen. This explains why all the patrol ships are steered by Chinese navigators. A rise of forty-eight feet overnight in the river during the

Above, Yankee Gunboat near Foochow; Below, Gunboat Conveying American Vessels on Yangtze River

flood season is not uncommon, and in a twinkling, millions of people are left homeless.

When the current becomes unusually dangerous, Yangtze "trackers," numbering from fifty to 200, haul the vessels through the rapids. These Chinese live in villages along the gorges and their occupation has been passed down for centuries from father to son. It is a sight to watch these scores of well-built men, naked except for a loincloth, harnessed to bamboo towing ropes, bent double on the narrow trail hewn out of solid rock, laboriously

Above, Typical Wreck Which Offers Pirates Chance for Pillage; Below, American Sentry in China

pulling a heavy junk up the river. Who are these ferocious river pirates? Where do they recruit their numbers, which run well into the thousands, and do they ply

their outlaw trade through necessity or sheer devilry? At some time or other they may have belonged to a more or less organized unofficial army. Perhaps the rebels disagree, scatter and go hungry. Whereupon, needing food and property quickly, they resort to banditry.

Once thus engaged, almost nothing stops them, for they know long stretches of territory so thoroughly that, when hard pressed by armed troops, they easily can lose themselves in some remote portion of China's vastness, there momentarily to simulate a life of peace and non-resistance until the representatives of law and order have left the vicinity. Aside from their common habit of hiding along the banks of the Yangtze to prey upon merchant vessels, many and varied are the ruses employed by the bandits to board commercial ships and steamers in search of plunder, money and ransom.

Often, for instance, they will steal a vessel—frequently an innocent-looking junk—and deliberately force another ship upon the rocks, where, partially wrecked, the victim vessel, passengers and crew will be at their mercy. Another common system of piracy is for a group of bandits, well armed, to disguise themselves as passengers and board a steamer. When once safely aboard, some prearranged signal is given and all of a sudden the robbers, stationed at several strategic points on the

DRY SHAVE IS NOW POSSIBLE
WITH ELECTRIC RAZOR

ship, flourish their weapons, and, if they deem it expedient, shoot to kill.

A striking example of this took place some months ago on the British steamer "Haiching" when it was riding a remote stretch of the Yangtze. The exact number of casualties is not known since some passengers jumped overboard, others escaped in one of the vessel's lifeboats, and still others perished by drowning. However eight bodies were found, the known wounded numbering twenty-three. Fortunately the attack finally was frustrated by the determined resistance of the captain, ship's officers and crew. The pirates, who were between twenty and thirty all told, succeeded in setting fire to the ship and it was due only to the timely arrival of three armed British vessels that the "Haiching" was saved from destruction.

Women pirates are by no means rare. Recently a woman led a piracy on the steamer "Deli" while it was traveling from Hongkong to Swatow. Many passengers were wounded and three taken for heavy ransom. Then a party of bluejackets came to the rescue and escorted the ship back to Hongkong.

How Dry Shaving Is Accomplished, Top, and Below, Interior Details of Electric Razor

Requiring neither blades, lather or cleaning, an electric razor has been developed by a pioneer in the field. It operates either on alternating or direct current and has but one moving part. The motor that drives it develops one-ninetieth of a horsepower and actuates a shearing plate that cuts the whiskers much like a hair clipper. The whole assembly weighs but eight ounces, and the manufacturer claims it is impossible to cut yourself with

it. It operates by slight pressure against the face and sliding up and down. The motor has several unusual features. The rotor is laminated, and has neither windings nor commutator. Make-and-break contacts of tungsten take the place of the commutator bars.

Chicago, with 604, has more hotels than any other city, but New York leads in number of guest rooms, with 126,632.

BUFFALO TURNS WATER PUMP TO IRRIGATE RICE FIELD

Rice fields along the banks of the Nile, in Egypt, are irrigated by wooden water wheels turned by buffaloes. The animals are driven in a circle around a horizontally placed wheel with teeth which engage the spokes of the water wheel, raising water to the level of the irrigation ditches.

Central Arch of New Westinghouse Bridge, Which Will Shorten Autoists' Time Between Pittsburgh and the East

LONGEST CONCRETE ARCH SPAN NAMED "WESTINGHOUSE"

Two hundred and sixteen feet above the stream, the new George Westinghouse bridge soon will replace the old Indian trail to the west, spanning the wide Turtle Creek valley near Pittsburgh. It is the critical link in the new Lincoln highway cut-off, shortening time and distance between Pittsburgh and the east. The improvement, almost five and a half miles long, eliminates a hill with a nine-per-cent grade, dangerous curves and long the cause of much traffic congestion. The bridge consists of five reinforced-concrete arches, of which the central one is 460 feet long and said to be the largest concrete-arch span yet built in the United States. When finished, the total cost of the bridge will be about \$4,500,000.

PETROLEUM COKE IS EFFICIENT FUEL

Coke made from petroleum has been found to offer an efficient fuel for both industrial and domestic use. In the refining of crude oil, a jelly-like residue remains after the more volatile constituents, such as gasoline, kerosene and lubricating oils, have been driven off. This residue is made into coke, and for every barrel of oil treated, chemists can recover from eighteen to 143 pounds of this fuel, which looks like coal and is composed of ninety-five parts of carbon and five of hydrogen. It burns almost completely, leaving virtually no ash, and is regarded as the purest form of industrial carbon available in large quantities. It is used in the manufacture of carbon electrodes, carbon brushes, abrasives, ferro-alloys, steel, paints, illuminating gas, brick and lead pencils, for heating orchards imperiled by frost and for smoking hams to give the meat a hickory flavor. The annual production in the United States is about 1,500,000 tons.

Small Plane Virtually without a Tail and with Its Elevator in Front; in the Air It Appears to Be Flying Backward

PLANE THAT FLIES "BACKWARD" HAS ELEVATOR IN FRONT

Giving every appearance of flying backward when in the air, a midget airplane of unconventional design is virtually without a tail and has its elevator on a projection in front. The latter feature is said to guard against stalls, and a small wheel, far forward, protects against nose-overs. The cabin is back under the wings, and the craft, which weighs only 450 pounds, is driven by a thirty-horsepower motor.

GOLD TRAPPED BY CARPET NAP IN LATEST SLUICE BOX

Carpet or burlap nap traps ninety-eight per cent of the gold passing through the latest sluice box designed for placer mining on the sand bars of Colorado streams. Fortunes in the shining flecks, known as "flour" gold, are expected to be taken from the sand by the apparatus. Screens so fine that water will scarcely pass through them, are features of the sluice box. A riddle board of unusual design whirls the gold flecks and black sand in the second step of separation, sending them into a trough. A lining of carpet or burlap is used in the trough, the particles of gold being held by the nap.

SHINGLES FOR INSIDE FINISHING GIVE NOVEL EFFECT

Shingles often can be used to excellent effect in interior finishing. Particularly is this true in the case of the log house or

the rustic cabin. One such vacation house was constructed in California, in which the living room has one wall of stone, incasing a gigantic wood-burning fireplace, and the other three walls are finished in long shingles, nailed from top to bottom with the thick end up, instead of from bottom to top with the thick end down, as is done in the case of a roof.

Air-Conditioning Unit for the Home Which Supplies Warm Air in the Winter and Cool during the Summer

WARM OR COOL AIR FOR HOME DELIVERED BY SAME UNIT

Warm or cool air, as required, is delivered by a compact air-conditioning unit for the home recently developed. This device, about the size of an ordinary furnace for a small home, is adaptable to straight air conditioning or a combination of air conditioning and radiator heating, so that it is, in fact, equally available for heating the house in winter and cooling it in the summer.

EXPLOSIVE FROM NATURAL GAS IS SAFE AND CHEAP

Butane, a simple compound of carbon and hydrogen, has been combined with sodium chlorate to produce a new powerful explosive which eliminates much danger from blasting operations. By compressing wet natural gas over oil, the butane is produced at low cost, while the sodium chlorate also is cheap. A Los Angeles chemist prepares the explosive by soaking in butane a simple cartridge of crystalline sodium chlorate. The standard electrical apparatus is used in detonating the charge, but if an hour or more elapses before the cap is fired, it is harmless because the butane has boiled away. This increases safety of blasting, since the dan-

ger from an unexploded charge literally evaporates within a short time. Hazards of transporting the explosive are eliminated, because butane and chlorate are stored in separate containers. Neither chemical alone will explode.

A2403

CLOUDY DAYS LIGHTER IF SUN IS PARTLY HIDDEN

Daylight may be brighter when the sun is partly hidden than when the sky is clear. This is indicated by experiments with an automatic photographic recorder at Manitoba agricultural college. When the sky is covered with light clouds and the sun itself is out of view, the recorded illumination was found greater than in full sunlight in a cloudless sky. Thus, though a cloud in front of the sun might reduce light intensity by thirty-

five per cent, this would be more than balanced on favorable occasions by the reflecting effect of a cloud bank. Of course, when the unobscured sun was also reinforced by reflecting clouds, the brightness was at a maximum. The apparatus consists of a photo-electric cell connected to a galvanometer.

Photos Taken in the Dark

FIFTY famous men, sitting in a pitch-black room, heard a voice say, "Sit still, gentlemen; you are now being photographed."

Zz-z-zii-ipp—one second! The camera had spoken. Lights went on. In about one hour, they were shown a photographic likeness of themselves, each face plain and recognizable.

Dr. C. E. Kenneth Mees, director of the Eastman laboratories, had been asked to entertain members of the National Research council with something which had never been seen before. How was it done?

Infra-red light, invisible to the eye, but not to the newly developed, highly sensitized film in the camera, was used to accomplish the feat. Sensitizers, discovered and applied during the past year, have sped up the possible infra-red sensitivity of photographic emulsions to the point

Above, Picture Taken by Visible Rays; Below, One Taken with Invisible Infra-Red Rays

where the picture could be made almost instantaneously, Doctor Mees explained.

The spectrum, it is explained, is divided into two sections, visible and invisible light. Visible light is the color of objects around us, all the colors of the earth and sky. But beyond the visible band of light, at opposite ends, are two invisible light regions embodying the infra-red and ultraviolet. Infra-red is the color following directly upon the color red as we know it. And ultraviolet is the color extending beyond the color we call violet.

The only limit to the range of infra-red rays for long-distance photography is the curvature of the earth itself and the altitude which men can reach, said Doctor Mees. If aircraft could fly high enough, it would be possible to photograph an entire country the size of Belgium, Holland or Ireland in a single exposure. Actually, infra-red plates now are so perfected that, flying four miles over Dayton, Ohio, you could photograph Detroit, Mich.

Such long-distance photographs are taken by placing a color filter over the camera lens, so that all light visible to the eye is absorbed and prevented from acting on the chemically sensitive plate. Of course, the panorama is bathed with sunshine, much of it invisible.

In astronomy, the infra-red plates have made it possible to photograph the spectra of stars three magnitudes fainter than could heretofore be caught and have proved that the planet Mars has an atmosphere.

Infra-red photography is now possible to the amateur. By equipping his camera lens with a suitable filter to cut out visible light, and using infra-red-sensitive plates, it is possible to get long-distance results with a relatively short exposure.

Fifty-Million-Volt Flash to Smash the Atom?

Drawing Shows How Energy Is Built Up on Surface of Sphere; Right, Simple Form of Generator

Two fantastic dreams of man—transmutation of the elements and liberation of the energy stored in atoms—have been brought a step nearer actuality by the recent development of a simple and inexpensive form of high-voltage generator with which scientists hope to produce electric potentials of up to 50,000,000 volts. Such an apparatus is to be built at the Massachusetts Institute of Technology from the designs of a young experimenter, Dr. Robert J. Van de Graaff, who utilized a century-old electrical principle in making a small generator, recently demonstrated, which developed 1,500,000 volts, although it cost less than \$100. The simplicity and economy of the machine bring high voltage within the reach of almost everyone, for the apparatus consists only of two hollow copper spheres mounted on cylindrical glass rods which in turn are supported by triangular bases. At the base of the rods are small motors which drive continuous silk ribbons over pulleys and up inside the spheres. The silk belts are the charging devices carrying electric en-

ergy up into the spheres where it is drawn off and runs to the surface, leaving the interior without charge. One such sphere holds the positive charge, and the other a negative one until a tremendous amount of electric energy is stored, to be released by a spark discharge. This relatively simple machine employs static electricity, and the principle is similar to getting a spark by rubbing a cat's fur. The larger apparatus to be built at the institute will have fifteen-foot spheres, about six times as large as those used in the re-

cent demonstration. Among important uses to which this apparatus may be put is the making of X-rays of a penetration comparable to gamma rays from radium.

AUTO TIRES RUN UP HIGH "FEVER"

Automobile tires, under continuous runs, generate such heat that in some cases their temperature mounts to 200 degrees Fahrenheit. This fact was revealed in recent tests in which a series of temperature readings was taken. Other tests with air-cooled tires in which many holes run through the tread, revealed a temperature difference of as much as thirty-six degrees between these and the ordinary type. As the air-cooled tire is cushioned against the road, the holes are compressed and heat is expelled. As they expand they draw in cooling air. Truck tires ran a temperature of as much as 230 degrees.

FLEXIBLE PERCHES FOR CANARY BIRD DESTROY MITES

A new perch for song-bird cages is fastened at only one end through a spring. When the bird jumps onto it, it swings like a twig in a tree. A small glass cup around the spring is filled with a mite-destroying solution, giving the pet freedom from these pests.

Perch That Gives Bird the Spring of Natural Twig
Also Rids Him of Insect Pests

Plane and Camera Helped Astronomers Observing the Leonids; Long Streaks on Photograph Indicate Meteors, Short Streaks, Stars

PLANE AID TO ASTRONOMERS IN STUDYING METEORS

Camera and airplane helped astronomers in their study of the Leonids, rare shower of meteors, at Las Vegas, Nev. The plane was used to climb above drifting clouds to get a closer view of the streaks of fire, while the camera drew a remarkable picture of the meteors. Long streaks were left on the photographic plate by the Leonids, while the stars left shorter white lines, the result of the earth's motion in thirty minutes.

The MAN BEHIND

AT THE close of the 1931 flying season nearly 500 individuals had crossed the Atlantic in aircraft. The year witnessed the record-breaking long-distance hop of the "Cape Cod," from the United States to Turkey, and the swiftest round-the-world whirl by Post and Gatty in the "Winnie Mae."

In 1931 men proved that they had become expert in the handling of aircraft, and the airplane proved its astonishing dependability. Indeed, every factor connected with transatlantic flying was under control, except the weather. That was the topic of conversation at international round tables where aeronauts and financiers gathered to discuss projects for extending existing air routes to nations overseas.

Those who asked aid from Dr. James Kimball, the weatherman whom every transatlantic flyer consults, learned that the greatest assistance Uncle Sam can offer now falls short of what is necessary for a regular transatlantic air service.

Above, LeFevre and Lotti, French Flyers, Consulting Dr. James Kimball, Government Meteorologist; Below, Testing Blueness of Sky with Color Chart

Ocean Flight HEROES

British Bombers in Clouds; Right, Observer Using
Theodolite to Watch a Free Balloon

Doctor Kimball's fame as a transatlantic weather prophet began with the Lindbergh and Chamberlin flights. He started Lindbergh off on the great circle at an hour when flying conditions were unusually favorable over most of the Atlantic.

The recent adoption of three-dimension weather maps for land stations provides government and commercial flyers with information of what goes on in the air lanes as well as on the ground. A three-dimension weather map of the high seas is the dream of flyers, but is so remote at present that one can hardly consider it. "We should be content," said Doctor Kimball, "if we had sufficient reports only about what happens on the ocean's surface."

In the light of his experience, Doctor Kimball believes that a transatlantic flight without the following conditions should be classed as a stunt:

1. A well-conditioned plane with a flying radius twenty-five per cent in excess of the ocean hop, and a crew of two.

Top, Transatlantic Air Routes Proposed by Doctor Kimball;
Below, Transmitting a Weather Map by Teletype

routes and less hazardous than the great circle.

The problem of operating commercial airship routes across the Atlantic is fraught with problems different from those which confront airplane operators. An important study of transatlantic airship routes has just been completed by the International Zeppelin Transport corporation, under the direction of Comm. J. C. Hunsaker, vice president of the Goodyear Zeppelin corporation, who predicts that a weekly year-round service between Washington and Paris would have an eighty-per-cent efficiency.

Commander Hunsaker, who was chief of the navy's aircraft-construction forces during the war, has conducted many theoretical flights across the Atlantic by airship. With data assembled for the weather bureau by ocean vessels over forty years, he has completed 500 voyages, during which he found that gales sweep the great-circle course about one-third of the time, and fog prevails off the Grand Banks one-third of the time, indicating that, in winter, the airship must follow a southerly route.

The feasibility of south-Atlantic routes for airplanes is less certain than that of north-Atlantic routes, although about a dozen airplanes have already flown from

2. A pilot who can fly blind both night and day.

3. A navigator who can check his course and instruments astronomically.

4. A radio operator who can talk freely with other operators.

The route most favored by Doctor Kimball is the steamship route. The distance is shorter than the arctic and Azores

Europe or Africa to South America. The French government, having the greatest faith in the airplane's supremacy, and hoping to dominate the south Atlantic, has under construction a large fleet of seaplanes designed especially for long-distance flights. The inauguration of a regular fast-mail service from Paris to St. Louis, Senegal,

Courtesy North German Lloyd

Above, Radio Operator on "Leviathan" Receiving Weather Reports from Land Station; Below, Releasing Meteorological Balloon from Ship

Africa, and the east coast of South America is scheduled for the near future.

The latest meteorological survey of south-Atlantic flying weather was undertaken by the North German Lloyd steamer "Sierra Ventana," on behalf of the German government in preparation for the flight of the world's largest seaplane, the "DO-X."

Under the direction of Capt. D. Ballahr, officers of the vessel conducted a series of balloon observations on the voyage from Bremen to Rio de Janeiro. The trial balloons were forty inches in diameter and, when filled with hydrogen gas, were sent aloft two or three times daily. Ship officers watched their flights through the atmosphere with a theodolite, and after

tabulating the results, they radioed the information to the German weather observatory, which in turn advised navigators of the "DO-X" on conditions which might be expected.

These balloons were so constructed and adjusted that they rose into the atmosphere at a regular rate of about 900 feet per minute. Theodolite readings were taken every minute of the height, direction and speed. These data were then charted on the same map which

marked the course of the "Sierra Ventana." Thus they arrived at fairly accurate information on the relation between surface and stratospheric wind movements.

In clear weather, the balloons were observed at heights of 60,000, 65,000 and 70,000 feet. The highest altitude at which a balloon was observed was 91,000 meters—or fifty-six miles! (The world's altitude record for human beings is ten miles.)

Only expert observers could have followed the erratic flights of these balloons. They frequently traveled at airplane speeds; several times they were seen to exceed 150 miles per hour. One of the balloons, which had reached an altitude of about 70,000 feet, was visible for a little over an hour.

Backing Your Car Out Is Unnecessary if the Garage Has Turntable

TURNTABLE FOR HOME GARAGE MOVES AS DOOR OPENS

Backing the automobile out of the private garage would be unnecessary if you owned a "gyrogarage," which has a turntable on which the car moves as the door opens. The auto is driven in and half turned as the door closes. When the door is opened from the other side, the auto completes the revolution, and is ready to be driven out. The inventor has constructed a model of the gyrogarage, and claims that a private garage equipped with the turntable can be built almost as cheaply as the ordinary one.

SHIFT IN SAXOPHONE CONTROLS MAKES IT EASIER TO PLAY

Shifting the octave mechanism from the upper to the under side of the mouthpiece and installing a swivel thumb rest, are

two improvements making the saxophone easier to play. The change in octave controls is designed primarily to protect the delicate mechanism against careless handling. In its old position on top of the mouthpiece, the octave key was

easily bent or broken. The swivel thumb rest moves with the thumb regardless of the position in which the instrument is held, adding greatly to the ease of holding and playing.

WOODEN DOOR RESISTS FLAME BY EXHALING CHEMICALS

Chemically treated wooden doors resist fire six times longer than a metal-covered door, it has been found in recent tests. A door, two inches thick, held back flames for one hour, exhaling fire-extinguishing chemicals when it was subjected to heat. The chemicals formed a wet skin on the surface, and the molecules of the layer exploded at the touch of fire, throwing off tiny sprays of fire-extinguishing fluid. As this layer burned off, new films formed underneath. Smoke poured through the joints, and flames appeared in ten minutes when the metal-covered door was tested. The door saturated in chemicals resisted until the wood was one-eighth inch thick.

EXTRACTOR FOR BROKEN BOLTS MAKES WORK SIMPLE

Mechanics and others who are afraid to "lean" on capscrews or stud bolts for fear of breaking them, now may turn them up as tight as necessary, and if they snap, their removal is an incident rather than a time-consuming operation.

The extractor outfit consists of drills of various sizes, with each of which is provided a fluted steel extractor of corresponding diameter. A centering bit and guide also is furnished to start the drilling. The hole is bored in the broken stud, the extractor of the correct size tapped in, the wrench head fitted and the shell turned out. Heavy-duty extractors also are provided for locomotive and other large studs. It is not necessary to dismantle the job before the extractor can be brought into play.

LIGHT BULB GLOWS FOR HOURS WITHOUT ELECTRICITY

Light bulbs that glow continuously for six months without electric current to light the filaments may be used for illumination in the future. This prediction was made recently by Prof. Charles T. Knipp, before the American Physical society, after he had outlined his experiments with a bulb filled with nitrogen gas. Afterglow from this lamp has given light for as long as three hours after it had been charged with an electrical flash for one-tenth of a second. Brilliance of the nitrogen lamps was found to increase, rather than decrease, over a certain period of time. The glow was described as bright enough to permit reading by its illumination, and yellow in color.

ANCIENT IDEA OF INSULATION SERVES MODERN PURPOSE

Straw-thatching, which gave ancient and many present-day savage races an insulated and water-shedding roof, has been employed for a modern purpose in Sumatra. A giant shed has been constructed there, built entirely of straw, for the curing of tobacco. Many openings are provided for the free passage of air at dry periods of the day, while, at night and in damp weather, the openings are closed and the straw keeps out the moisture.

Courtesy Celotex Co.
Shed Built Entirely of Straw Is Found Best for Curing Tobacco in Sumatra's Rapid Climatic Changes

By Checking Battery with "X-Rayoscope" You Can Tell Quickly the Condition of Its Individual Cells

HOW GOOD IS BATTERY SHOWN BY "X-RAYOSCOPE"

How good or bad your battery may be, and whether the trouble is in one cell, two or three, is quickly determined with an instrument named the "X-rayoscope." It is in appearance much like the stereoscope that once adorned every library table, fitted with wires for attaching to the battery. Three stars are visible inside the visor, and if they all show green, the battery is a good one. If they are green and red, the battery is fair, and if deep red, it is dead. If one of the stars is of different appearance, the relative value of the corresponding cell is indicated by the color.

WEARY WAITING IS OBIATED BY RENDEZVOUS TABLET

Public Meeting Place Provided with Message Tablet
So Long Waiting Is Unnecessary

If the person with whom you have an appointment in Hannover, Germany, fails to appear on time, it is no longer necessary to stand around and wait wearily for him. Hannover has set up a tablet at the intersection of eight streets and marked it off into a number of squares. The first person at the appointed spot needs merely to write in one of the squares where and when he can be found. The tablet has proved exceedingly popular.

FILM OF OIL SUSTAINS WEIGHT OF QUARTER TON AN INCH

Oil films two ten-thousandths of an inch thick have been found to support weights averaging almost a fourth ton per square inch. The films are formed in high-speed machine bearings, and their performance was found in experiments at Pennsylvania state college, which showed oil films capable of carrying these extreme weights can be had simply by placing the oil holes properly. When that is done, "riding on oil"

becomes a literal fact. The hub of a wheel turning on its axle illustrates what the testing devices disclosed. The weight rests on top of the hub, pressing it against the axle which supports it, with the expected result that underneath the axle there is more space than on top. As the wheel speeds up its revolutions, oil is dragged upward into the narrow top area and compressed until it acquires tremendous weight-sustaining power, the maximum compression rising faster than the weight as the latter is increased. On the test machine, 100 pounds of weight resulted in a maximum of 250 pounds to the square inch compression in the oil film, but a weight of 400 pounds produced a maximum oil-film pressure of 1,400 pounds to the square inch. Although almost too thin to be visible, the oil film at this compression completely separated the two metallic surfaces, but at weights above 400 pounds, the oil film began to break down.

CLOCK DIAL FOR TESTING EYES WARNS OF ASTIGMATISM

Black-striped circles on the dial of a clock now on the market will reveal eye trouble. If the circles do not appear equally black, then there is reason to believe that astigmatism is present. The circles, of alternate black and white stripes, are in the place of the usual numerals. The principal use of the clocks is to warn of the need for an eye examination.

Striped Circles Warn of Eye Trouble if They Do Not
Appear Equally Black

Police Rookies Use Masks in Gas-Attack Drill

They Might Easily Be Taken for a Group of Goblins Out of a Fairytale, but Actually They Are Police Rookies at Philadelphia's Training School Learning to Use Gas Masks

One of the steps in developing Philadelphia's future policemen at the city's training school is to teach the rookies how to use gas masks in case they are called on to enter gas-filled homes or to repel gas attacks of criminals. In such a drill, the student policemen all don the masks

simultaneously and enter a gas-filled room where they learn immediately if their masks are worn in the proper way to be effective. A recent picture of a squad of rookies about to undergo a baptism of gas might easily be mistaken for a group of goblins out of a fairytale.

a 2247

WEATHER MAKING FOR HOMES OPENS NEW INDUSTRY

Making comfortable weather for homes and office buildings is likely to develop into a \$250,000,000 industry within the next twenty years. This is the prediction of Thornton Lewis, a heating and ventilating engineer, who finds that the manufacture of weather for buildings has become an exact science within the last twelve years. One of the latest applications of manufactured weather is in the air conditioning

of railway cars, but air conditioning of homes is hardly started, and few office buildings, hospitals or churches have any provision for controlling the temperature or humidity of the air that is used, except by ordinary heating methods. Growth of this industry, it was predicted, will result in an increased consumption of electrical energy, and may mean improved conditions in the ice industry, since ice is being used for air conditioning in homes and small installations, for which over 150,000 tons will be needed, he estimated.

Push-Pull C.W. Transmitter Is Easy to Build

Built almost entirely of receiving equipment, this up-to-date short-wave transmitter, including all necessary parts, will cost approximately \$45. A milliammeter to read the plate current, the use of which is strongly recommended, will add \$7 or \$8 to this amount. The two thermocouple ammeters, in series with the antenna

mitter circuit is shown in Fig. 1: coil L₁ for 80 meters consists of 12 turns with an inside diameter of 2 $\frac{3}{4}$ in.; for 40 meters, 8 turns and inside diameter 1 $\frac{5}{8}$ in.; for 20 meters, 4 turns and same diameter. All L₁ coils are made with $\frac{1}{4}$ -in. copper tubing. The L₂ grid coils are wound on 1-in. forms and are tapped in the exact center. When completed, these coils should be coated with collodion. Grid coil L₂ for 80 meters consists of 72 turns of No. 32 s.s.c.

wire; for 40 meters, 40 turns of No. 28 d.c.c. wire; for 20 meters, 16 turns of same-size wire. The two L₃ coils consist of 7 turns of $\frac{1}{4}$ -in. copper tubing and have an inside diameter of 1 $\frac{5}{8}$ in. These coils are not changed for the various wave bands. Complete material list and further details are available. Fig. 2 shows connections for parallel tuning, and the power unit diagram is given in Fig. 3.

Coils L₁ and L₃ are mounted on small porcelain stand-off insulators. The grid coil L₂ is clipped into a standard resistor mounting as shown.

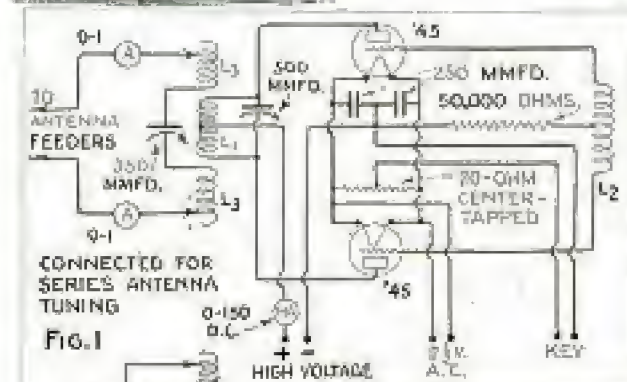

FIG. 1

FIG. 2

feeders, are not absolutely necessary, but are very helpful in tuning. The set is not a toy or flea-power outfit in any respect. It is intended for practical communication and will do anything that the type 10, in common use, will and better at greatly reduced cost. The baseboards for both the transmitter and power supply are of the same size, each being half of an 18 by 26-in. breadboard. A commercial power-supply unit for this transmitter is shown in the upper photo, and the home-made type at the lower right. The trans-

Simplified Light-Control Units

A new light-sensitive cell, recently introduced in this country, is known as the radiovisor bridge. It consists of a tall glass tube with a

a second relay, provided with a vacuum contact device, enables handling several hundred watts for practical work. For more intricate applications, radio tubes can be employed in

Light-Sensitive Cell and Impulse Circuits, for Both Battery and A.C. Operation, That the Experimenter May Build with Standard Parts to Control Other Electrically Operated Apparatus

three-prong base. Inside the bulb is a flat plate supported by two heavy lead-in wires. Owing to the considerable amount of current that can be passed through this cell, as compared with the usual photo-electric cell, it is claimed to greatly extend the possibilities of light-control. It may be used to operate a relay direct for controlling a circuit of a few watts, while

very simple circuits owing to the higher initial current available. The bridges are supplied in both a.c. and d.c. types and the circuits for the operation of each are given. In England and Germany, the bridge and associated equipment have been applied to burglar and fire alarms, street-lighting control, fog detectors, automatic counting, color matching, etc.

Dynamometer Is Run by Battery

Battery-operated dynamometers are now being used in auto radio installations to provide the necessary high B-voltage. They operate from a 12-volt storage battery and deliver about 220 volts of direct current. This is more than sufficient for the average auto set, and will be found suitable for operating many standard receivers in rural districts where farm-lighting plants are in common use. The square box, on the top of the machine, houses a terminal strip

and a small filter unit, consisting of two condensers and two chokes. It is claimed that all ripple and noise are eliminated with this filter. The device occupies little room and may be housed in a standard battery box installed below the floor.

Protecting Tubes in Short-Wave Sets

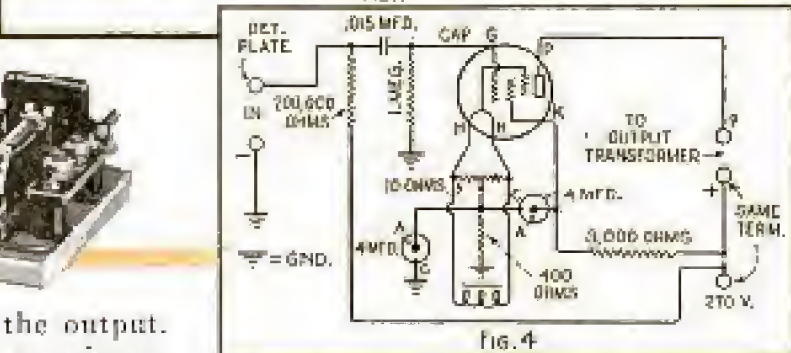

The new type 30 tubes, used in short-wave sets, require a filament-battery voltage of 2.2, and this should not be exceeded, or the life of the tube will be greatly shortened. A d.c. voltmeter should be connected permanently across the filament of the tubes. One meter may be used for all tubes, as they can be connected in parallel and served with a single rheostat.

For further information on any radio construction article write to the radio department; this service is free.

Electrical Specialty Co.
Stamford, Conn.

Pentode Amplifier without Altering Old Sets

The new pentode power-amplifier tube may be added without dismantling the audio section of the receiver. Later, if the builder is satisfied with the performance of the new tube, he can easily make a permanent installation. All parts are mounted on a $3\frac{1}{2}$ by 7 by $\frac{1}{4}$ -in. metal base. The layout is clearly shown in Fig. 1, A on the electrolytic condensers indicating the insulated terminal and C, the container can which is the other terminal. These connections should be made exactly as in the diagram. Fig. 2 gives the details of the input and output terminal strips; Fig. 3, the double resistor assembly, and Fig. 4, the complete wiring diagram. The .015-mfd. condenser and tapped filament resistor are not to be fastened with screws. The condenser terminals are soldered directly to the coupling-resistance mountings, and the tapped resistor to the socket terminals. A separate $2\frac{1}{2}$ -volt 1½-amp. filament transformer is used, and the 270 volts for the plate is

taken from the set supply to the output. The present speaker transformer primary is connected to the output terminals. The amplifier input is connected directly to the detector-tube plate in the set, and all other audio equipment is discontinued. Fig. 5 shows an optional resistance and capacity coupling where both plate and grid circuits are filtered for maximum results. R_1 and R_2 are the same as used in Fig. 4; R_3 is 50,000 ohms, and R_4 100,000 ohms.

All-Wave Super Tunes from 20 to 550 Meters

The pleasure of hearing programs on all waves not only from this country but from far-distant lands is no longer confined to the laboratory. The sonorous chimes of a bell tolling the hours may float into your home over the evening air, and, shortly, a voice may tell you it was Big Ben, in the House of Parliament in London, that just struck the hour of midnight, and wish you goodnight. Your watch tells you it is just 6:00 p.m. in Chicago. This custom-made superheterodyne is designed and built for the necessary sensitivity to bring in this station, and others 10,000 or 12,000 miles away, with loud-speaker volume. Tests show selectivity of the 10-kilocycle order, sufficient to cut out powerful locals and bring in broadcasts from practically the whole world. The circuit used is basically a su-

perheterodyne with 12 tubes, consisting of a stage of r.f. amplification using a screen-grid-type 224-tube. The first detector employs a 224-tube, the oscillator a 227, and three stages of extremely high-gain intermediate-frequency amplification is obtained with type-224 tubes. The power second detector employs a 227-tube; two push-pull audio stages are used, the first having two 227's and the second two type-245's. This last push-pull stage with a type-80 power unit is separate from the receiver, as shown in the upper photo, and is designed to handle the high output of the second detector for faithful repro-

duction without blasting or distortion. Sensitivity control is obtained with a switch on the front panel for long-distance, medium-distance and local recep-

J.O.A.K
JAPAN

tion. Complete shielding, careful balancing and precautions to prevent changes in coil characteristics, due to climatic changes, are special features.

Prolonging Life of Rectifier Tubes

All types of rectifier tubes should be operated under conditions that provide good ventilation. Tubes of the 80 or 81 variety may be housed in metal cabinets provided holes are drilled in the cabinet. Heavy-duty rectifiers, such as the type 866, should not be boxed in a metal cabinet. They should be mounted in bread-board fashion and placed in a safe location where there is free access of air. When these tubes are to be worked near their maximum output, it is sometimes necessary to force circulation around the bases by means of an electric fan. With these tubes, as with any rectifier tube, the rated filament voltage should be carefully maintained. Running the filament at lower than normal specified voltage shortens the life of the tube. All rectifier tubes of the mercury-vapor type should be given ten or fifteen minutes to heat up before the plate voltage is applied.

Old Tube as Lightning Arrester

A burned-out tube may be inserted in a socket and mounted inside or on the outside of the building as shown, to act as an inexpensive lightning arrester. The antenna and ground leads are connected to the grid and plate terminals of the socket. The small space between these elements and the high vacuum, provide an easy path for static voltages.

Labels for Tube Records

Tubes tested at regular intervals should be marked with the result of each test so that earlier readings may be compared with the one just taken. Small gummed labels pasted on the bases provide a handy means of keeping these notes.

Grandfather Clock Houses Radio Set

Electric Grandfather Clock Showing Radio-Control Panel and Speaker

Built into a cabinet closely following the lines of a colonial grandfather clock, this 8-tube superheterodyne receiver is 66 $\frac{3}{4}$ in. high, 16 in. wide and 10 $\frac{3}{4}$ in. deep. An electric clock and auditorium-type dynamic speaker complete the assembly. Variable mu tubes are employed in the circuit, and push-pull pentode tubes in the output.

Improved Binding-Post Strip

Unnecessary service calls may be avoided by the general use of an improved binding-post strip in which it is not so easy for the antenna to touch the chassis and ground. The wireguide takes any size wire and holds it away from the metal chassis. A tinned soldering tab is provided for the ground post.

Blueprints covering radio construction articles in past issues can be obtained for 25 cents each; material lists are always available without charge.

POWER for Amateur-

By ROY E. DAVY

PART II

ANY good B-eliminator with two variable voltage taps and an output of at least 200 volts at 40 milli-amp., may be used with the special amateur-band receiver described in the January issue. In this case it would be necessary to provide a separate filament transformer to deliver 2½ volts at 6 amp.

The complete power unit now illustrated and described was designed and built especially for this receiver. It is quite simple and operates perfectly without noticeable hum. The complete installation has been in use for several weeks and is giving excellent results on both c.w. and phone. Experienced short-wave listeners have found that maximum results with a short-wave receiver are much more easily obtained if a means of varying the plate and screen voltages is provided. This is a feature of the present unit.

The metal container is 12 in. long, 7 in.

wide and 7 in. deep. It may be made from copper, brass or eraydo, as desired. The bottom and top covers are turned down ½ in. all around to make a snug fit. The bottom is soldered in position and the top is left removable. A number of ventilating holes are drilled in the sides and top. An

opening, 2½ in. wide and 6 in. long, is cut in one end for the bakelite control panel, which is 3 in. wide and 6 in. long. Machine screws on each side hold this panel in position. The three carbon-type variable resistors and five binding posts are then mounted on the panel. All other parts are mounted on a ¼-in. bakelite sub-base, cut ½ in.

SUPPLY Band Receiver

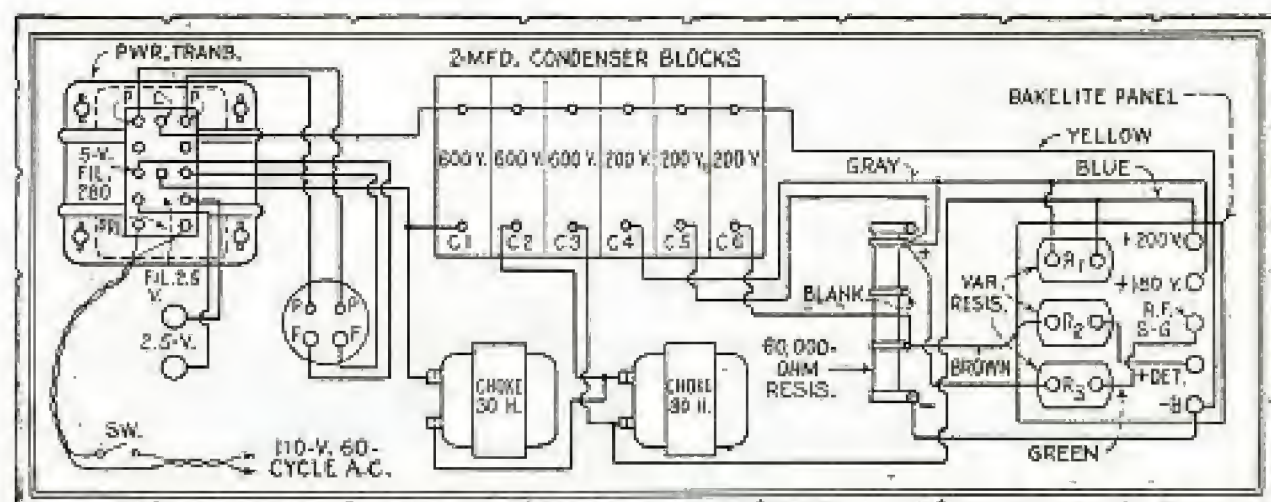

smaller in diameter than the inside of the box. The sub-base is elevated above the bottom of the metal container by means of 1-in. angle brackets screwed to each corner. This allows much of the wiring to be done below the base, as shown in the lower photo on page 296. The voltage divider R_4 is mounted at the right.

Holes are cut in the sub-base for the transformer, socket and condenser-block terminals. A standard type-245 condenser block, with all terminals grouped on one side, was used to save space. If single condenser units are preferred, it may be necessary to enlarge the metal case. The two binding posts for the $2\frac{1}{2}$ -volt filament supply are mounted on the left end of the base, as shown in the center photo on this page. Material list and enlarged diagrams are available.

The power transformer has a 600-volt center-tapped winding and also supplies the necessary filament voltages. When the

wiring is completed, set the clip from R_3 , which controls the screen-grid voltage on the r.f. tube, about 1 in. from the positive end of the voltage divider R_4 . The clip from R_2 , for the detector screen voltage, is moved on the voltage divider to a position about 2 in. from the negative end. The 5-ft. connector cable carries all leads.

Line Controls for the Amateur Transmitter

By F. L. BRITTIN

Grouped line controls not only make a better appearance but are necessary in case any tube starts to draw more than normal current. This article, concluding the series on the amateur crystal-controlled 50-watt c.w. and phone transmitter, shows a simple method of grouping the controls. A complete set of enlarged diagrams and a material list covering the installation are now available. Three 10-amp. snap switches are required, the master switch being mounted under the bakelite shelf, that supports the crystal temperature-control oven, at the right on the transmitter frame in the upper photo. Snap switch A in the No. 1 position turns on the filament and plate supply for the os-

illator, and the filament supply for the 565 buffer tube. In the No. 2 position, the same connection is retained and an additional contact is made to turn the plate voltage on the other tubes. Snap switch B controls the filament supply to all other tubes. It is absolutely necessary that the filaments of these tubes are allowed to heat for ten to fifteen minutes before the plate voltage is applied. To place the transmitter in operation, first turn on the master switch, then filament-switch B. After the tubes have been lighted for the period mentioned above, turn switch A to position No. 1 and then to No. 2. A good plan is to leave the filament switch B turned to the on-position at all times and cut the station line supply at the master switch. The switch A is turned to the off-position when listening in, but switch B is left on. It would be of advantage to

have the oscillator and buffer-tube filaments on a separate transformer. However the present arrangement works out very nicely. The bakelite panel for the filament-supply unit, shown at center, is $\frac{1}{4}$ by $7\frac{1}{2}$ by $17\frac{1}{8}$ in. This unit houses the separate $2\frac{1}{2}$, $7\frac{1}{2}$ and two 12-volt filament transformers with the necessary rheostats to reduce the voltage to 10 volts. A 500-watt linear amplifier will be described in an early issue.

AMATEUR MECHANICS

Clear-Deck SMOKING TRAY *fits EASY-CHAIR arm*

By BOB HARDY

A CARELESS sweep of the arm cannot knock anything overboard from this clear-deck smoking tray, as nothing projects above the $\frac{1}{4}$ -in. "coaming" around the edge, leaving a flat surface for books, magazines, scratch pad, lunch or beverages without interfering with the built-in gadgets. The set rests on the arm of an easy chair, out of the user's way, and can be removed instantly as there are no clamps or screws to hold it in place.

The wood to use is a matter of individual taste, although Philippine mahogany, maple, birch or redwood are suitable for a stained and varnished job and pine will do for a paint or lacquer job. First, a cardboard pattern is made for the arm brackets. Plywood is best for these, as they will not be likely to split and their exact shape, of course, depends on the individual chair. In case

the chair arm is level, both brackets can be made the same height, but as most chairs have arms sloping toward the rear, the rear bracket should be higher than the one in front so that the tray will remain level. The arm brackets, A and B, are nailed or screwed to the base block, C, the latter having a slot to receive the under brace, E, and also is cut away to clear the ash receiver. Level it on the chair arm be-

Smoking Tray Has Parts "below Deck," Where They Cannot Be Overturned, and Provides Space for Books and Magazines

fore fastening the arm brackets permanently, and locate the under brace also. Next, saw out the top from $\frac{3}{4}$ -in. stock, cutting the corners at a 45° angle and making a cut-out for the pipe rack, F, as well as for the ash receiver and the match box, as shown. The recesses for the emery-paper block and the lead plate are chiseled to a depth of about $\frac{3}{16}$ in. It is best to mold the lead plate first, as shown in the detail, and then trace its outline on the tray adjoining the ash-receiver hole. A mold is easily made of wood, as shown, using two nails for screw holes. Have the lead very hot before pouring, and use only enough to bring the surface flush with the top of the mold. This results in a neat job that needs no trimming or filing. The recess in the tray top can be chiseled for a neat fit, and the plate held in place with flat-head brass screws, the holes being countersunk with a jackknife so that the heads will be flush with the surface. The ends of the emery paper are folded over a small block of wood that fits loosely in the recess chiseled out for it, so that it can be picked out readily when new

emery paper is needed. The pipe rack shown is a "two-passenger" job, but it can be made larger so that more pipes can be accommodated as long as the rack does not interfere with the chair arm beside which it hangs. Drill $1\frac{1}{2}$ -in. holes for the pipe bowls in a $\frac{3}{4}$ -in. piece of wood of fair size and cut the outline later. If you attempt to do this after the rack has been cut to size, the wood is likely to split. Use an expansion bit, and cut $\frac{3}{4}$ -in. slots leading to the holes. The rack is backed with a piece of thin plywood, and a brace behind holds it at a 30° angle with the vertical. Around the edge of the tray, nail on a molding, $\frac{1}{4}$ by 1 in., rounded on top. This can be fastened with round-head screws, brass upholstery tacks or escutcheon nails. Miter the joints neatly. With the tray, D, complete, it can be screwed to the base block, C. On the user's side of the set, between the tray top and chair arm, a compartment can be built large enough to receive a tobacco pouch.

You may be able to find in the stores an ash receiver and match box of brass or copper which approximate the dimensions given, or you may make them yourself of hammered brass or copper. The ash receiver should have a bead or flange around the edge, to prevent it from falling through the opening cut for it, which should be a loose fit to allow easy removal. In finishing, use an oil stain to match the other furniture in the room, and add a dull polish with furniture wax. Some very attractive effects can be achieved with bright enamels, but these have the disadvantage that burns show up prominently. By reversing the design, this tray can be adapted to the right arm of the chair, though most smokers will find the left arm more convenient.

Drying Plaster Patches Quickly

When patching walls before painting or papering, the time required for a patch to dry can be shortened by holding a roll of burning paper over it. The heat drives out the moisture and hastens the drying. —Garry A. Brickman, Sewell, N. J.

Fireplace Conceals the Basement Stairway

Appearance of Basement Room Can Be Improved by Adding a Fireplace to Hide the Stairway

In partitioning off a room in a basement, the problem of hiding the stairway was solved by simply building an imitation fireplace in front of it, as shown in the drawing. The framework consists of 2 by 4-in. stock, upon which pressed wood, with an imitation tile surface, was applied. The fire box was made large enough to contain some wood and extended under the stairway, while the rest of the fireplace served as a partition next to the stairs.

Trim of 1 by 4-in. stock was fitted over the pressed wood, and a suitable picture built in as indicated. If a marble slab is available, this may be used instead of the picture. A shelf was added to accommodate knickknacks. It is a comparatively easy matter to build this fireplace which adds materially to the appearance of the basement room. Cozy nooks can be built on each side, with built-in seats, if you desire.—Charles Brinkman, Chicago.

An Aid in Ignition Timing

When timing the ignition of the model-A Ford, one often turns past the mark in the gear. This can be avoided by rotating the motor part of a turn backward, then moving it slowly forward again with the crank. To do this, use a heavy screwdriver, inserting it through the spokes of the small fan pulley on the crankshaft. If the fan belt is tight and the motor turns freely, the latter can be moved by turning the fan. This can be done easily if the spark plugs are removed to overcome the compression.

Hinged Sides Increase Usefulness of Sawhorse

Carpenters and odd-job repairmen can use this "winged" sawhorse to good advantage, as it supports a variety of work

that would ordinarily require two horses. The wings are made of light lumber and are hinged to the sides of the sawhorse so that they may be raised instantly. They are held in the horizontal position by an arm pivoted to the underside of the top.

Folding Sides Hinged to Sawhorse Adapt It to a Variety of Work

Ordinary Kitchen Table, Fitted with Drawers and Backboard. Provides Laboratory Table for the Young Chemist.

Workbench for Amateur Chemists

Fitted with drawers for supplies, an ordinary kitchen table can be made into a workbench for the amateur chemist. Cut a well in the top to receive a cake-pan sink, the inside surface of which is covered with an acid-resisting paint, and solder a short drain pipe in one corner to empty into a bucket placed underneath the table. Then nail a backboard to the edge of the table as shown. A large can for distilled water, having a length of copper tubing, fitted with a petcock, soldered to it, is fastened to the backboard with metal straps. The test tubes, flasks, etc., are kept in wooden racks also nailed to the backboard. The top of the table should be covered with sheet zinc, extending down over the edges and nailed to them, or it, too, may be coated with acid-resisting paint.

Film-Developing Clip from Cork

For the amateur photographer who does his own developing, a film clip made from a cork will be useful, and has the advantage of not marring

the films. Take an ordinary cork of a suitable size to float the film and cut it as shown, so that when the two halves are placed together there will be a V-shaped opening at the top. A rubber band holds the film in the clip and pressure at the top forces the halves apart at the bottom to permit insertion of the film.—K. F. Keith, Chicago.

Singeing Frayed Ends of Silk or Rayon Cloth

Many silk or rayon garments are ruined by careless trimming of a raveling or a slight fraying in the cloth. If the thread cannot be worked back into its original position and the broken ends stand out, carefully singe them down with a lighted match. In doing this, the burned part will brush off as ash, leaving little or no trace of having been touched, and the ends of the burned strands will usually be melted together so that there is little likelihood of further trouble.

Short Wire Keeps Pot Handles Cool

Fastened to the bail of a cooking utensil in the position shown, a short length of wire will prevent it from becoming uncomfortably hot. With this arrangement, the wire strikes the side of the utensil when the handle is lowered, and keeps the latter from touching the hot pan.—L. E. MacNair, Lisbon, Portugal.

Liquid for Fireproofing Cloth

Fireproof liquid for cloth can be made by dissolving ammonium sulphate, 1 lb.; ammonium carbonate, 5 oz.; borax, 4 oz.; boracic acid, 6 oz., and common laundry starch, 4 oz., into 1½ gal. of hot water. The fabric is saturated with this solution, which should first be heated to about 86° Fahrenheit.

Cutting Bottles by Electrically Heated Wire

Clean Fractures around Glass Bottles, Tubing and Jugs Made by Using Electrically Heated Wire

Lamp bases, pedestals for supporting window displays, forms for winding coils, electrical insulators, glass funnels, gas generators and distillation condensers for the chemical experimenter, can be cut to any desired size by means of a wire heated electrically. The first step is to score the line at which the article is to be cut around it by means of a three-cornered file. An accurate method of doing this is to use the jig shown in the right-hand detail of the drawing. It consists of a wooden base on which two parallel cleats are nailed to take the bottle or jug, an adjustable stop clamped to the base, and a three-cornered file held as indicated by means of two iron or brass strips. The bottle is then rotated against the file to score a straight line on its surface, which is necessary to break the glass evenly. Another jig, shown in the left-hand detail, consists of a porcelain cleat receptacle screwed to a wooden base and provided with a heater element. Or, if you wish, a flatiron or toaster plug can be screwed into the receptacle, to serve the same purpose as the heater element. Two radio binding posts are mounted on the baseboard. The wiring should be carefully followed, and a plug provided for attachment to a con-

venient wall socket. The resistance wire may be either ordinary soft iron, nichrome, chromel, or any other kind, which can be heated to a dull red without melting or burning away too quickly, and the size may vary from No. 18 to 24. To find the proper length of the wire to use, attach one end of it to the binding posts while the current is off, taking care that the wire is not kinked. If the wire does not become red, it should be shortened, and if it assumes a bright yellow or white heat, a longer piece must be substituted. The proper length is indicated by a dull-red color. Pass the wire through holes drilled in a block of asbestos, as indicated by the dotted lines, and adjust the wire tightly around the bottle, directly over the scratch. Then turn on the current, and the glass will break evenly. In the absence of an asbestos block, you can substitute wood, provided the holes are lined with asbestos tubing. If the bottle is thin, the glass will fracture quickly. In the case of thick bottles, it may be necessary to fill the bottle with cold water up to the mark, before applying the current, or to submerge it in water up to the mark. The electric method is superior to that of burning a string saturated in alcohol or gasoline, as the wire heats a very small portion of the glass evenly all around, while a burning string develops more heat on certain portions than on others, which results in an uneven fracture. After the cutting has been successfully done, the sharp edge of the glass should be dulled with a file or emery wheel.

Swinging Woodbox Is Accessible on Both Sides

Hinged to the Baseboard, This Woodbox Keeps Out Cold Air When Open or Closed

Placed in an opening cut in the wall, this woodbox is hinged to the baseboard and tips forward like a flour bin. The construction is clearly shown. The front and back of the box are slightly larger than the opening in the wall to act as stops when it is opened or closed. The depth of the box should be greater than the thickness of the wall, and the back so made that it completely closes the opening when the box is tipped forward. In this way, the box may remain either open or closed without admitting cold air into the room.—E. L. MacFarlane, Fredericton, N. B., Canada.

Cause and Prevention of Noises in Hot-Water Pipes

Noises in hot-water pipes are often caused by steam being generated in the boiler when the bulk of the water is not near the boiling point. In localities where hard water is used, one of the circulating pipes often becomes choked by lime deposits, causing the water to circulate more slowly through that part of the boiler, where it boils in spite of the fact that other parts will be much cooler. This often occurs in large houses where heavy fires are kept and the water is constantly drawn off in large quantities. Such a con-

dition can be identified by the noise occurring when there is a good fire but the tank is not very hot. The remedy is to have the faulty pipe replaced. A similar kind of noise may be caused by a layer of fine scale or sandy deposit on the bottom plate of the boiler, and occurs soon after the fire has been lighted. This trouble is met with only in flat-bottomed boilers and can be remedied by having the boiler cleaned out. However, one of the most common causes of pipe noises is too strong a fire, and too little hot water drawn out. Then the water approaches the boiling point and causes the steam to escape noisily up the pipes. Drawing off the water and regulating the damper will stop these noises at once.—James T. Watkins, Astoria, N. Y.

Tilting Drawing Table Is Handy for Home Draftsmen

This tilting drawing board has two large cleats nailed to the underside which are pivoted to a sturdy leg of 2 by 4-in. stock. A number of small cleats are screwed on to the leg to provide rests for a prop hinged to the table top, so that the latter can be adjusted to various angles. The base consists of four lengths of 2 by 4-in.

Anyone Can Make This Drawing Table Which Is Fitted with an Adjustable Tilting Top

stock arranged as shown.—H. C. Thomas, Detroit, Mich.

Heat Removes Rosin from Knots Before Painting

Shellacking has been an accepted method for sealing knots before painting, but is not a positive preventive of bleeding. The following heat treatment has been found more effective: The flame of a blowtorch is played over the knot, taking care not to burn or scorch it, so that the rosin will be melted out, after which it is washed off with turpentine and linseed oil. This method actually removes most of the rosin, and a sealing coat of shellac is then unnecessary.

Jig Helps Form Arrow Feathers

Archers, making their own arrows, will find this little jig for shaping the feathers useful. It consists of two strips of brass or sheet metal, shaped to the contour of the feather and soldered to a spring-brass clip as indicated. The feather is cemented to the arrow shaft in the usual way, and the clip put over it.

The projecting part of the feather is then burned off by holding it over a small flame. After removing the clip, the feather is rubbed between the fingers to remove the charred edge.

—Harold I. Calkins, Lomita, Calif.

Heating Soil Around House Plants Induces Rapid Growth

It has been found that crop yields can be increased by heating the soil around the roots of growing plants with electricity. With little cost a similar method can be applied to the raising of house plants. Simply install a 10 or 15-watt electric lamp inside of an earthen flower pot, and set the plant into or over it, as shown. By burying a thermometer in the soil near the roots, the temperature can be read at

Electric Lamp and Socket Installed in Lower Flowerpot Warms Soil around the Roots

any time. The length of time necessary to burn the lamp for proper heating can be found by trial. During winter, it may be advisable to keep the plant heated throughout the night, and perhaps part of the day. If you find that too much heat is being lost through the pot, wrap the outside surface with several layers of asbestos, or if this is not available, paper can be used.

A "Sure Fire" Rodent Trap

Consisting of a $\frac{1}{4}$ -in. wire-mesh cage, $13\frac{1}{2}$ in. in diameter, tacked to a wooden top and mounted on a wooden base, this trap is easily made by anyone. The cage is hung 6 or 7 in. above the base on a trigger, which in turn is suspended from a heavy-wire support fastened to the base and extending up through the cage as shown. The construction of the trigger is shown in the detail. In use, the bait is stuck on the end of the trigger and the trap set. A pull on the bait drops the cage.

☛ Silver knives and forks can be cleaned with water in which potatoes have been boiled.

Ever-Changing Colors for Window Display

Revolving Color Screen, Run by Electric Clock, Constantly Changes Color Effects on Window Display

Effectiveness of window displays can be greatly increased by using a color curtain which throws ever-changing colors on them. The curtain consists of two revolving cylinders of red, blue and yellow translucent material, each housing an electric lamp, and an electric clock to rotate the cylinders, the whole assembly being contained in a suitable box. The cylinders rotate at different speeds so that there is a constant change of almost all the colors of the spectrum. The cylinders are 2 in. in diameter and 5 in. long, made from four rectangular colored cellulose sheets placed side by side and overlapped about $\frac{1}{16}$ in. The edges are fastened together by stapling or with collodion. There are two methods of using an electric clock to drive the cylinders. One is to remove the second hand and substitute a small pulley, and the other is to solder

a binding-post nut to the starting button to form a pulley. In the former case, one of the wood pulleys should be about the same size as the clock pulley. If the starting button is the driving part, use a wood pulley of large diameter. Of the two remaining wood pulleys needed, one is twice the diameter of the other, the exact measurements being unimportant. Mount the two pulleys on a board with wood screws, the separation depending on the space in which they are to operate. On top of each pulley, fasten a small 2-in. can lid to receive the colored cylinders. With belts made from small cords, connect the pulleys and clock so that the cylinders will rotate slowly, either at 1 and 2 r.p.m., or $\frac{1}{2}$ and 1 r.p.m., respectively. The exact manner of mounting the clock motor depends on the space available. Above the center of each cylinder, fasten, by means

of a crossarm bolted to an upright, two porcelain sockets to receive the lamps. It is essential that all moving parts work easily, and that the belts be neither too tight nor too loose. A pleated silk curtain is fitted over the open side of the box so that the colors will be slightly subdued. The clock draws so little power that it can be left running all the time, the color-curtain lights being turned on and off as desired. Of course, other motors can be employed to drive the cylinders, if the speed can be reduced sufficiently. The size of the lamps depends on the light desired and on the space to be covered.

Glass Trap Checks Cannibalism of Tropical Fish

Tropical fish that bear their young alive often eat these, and it is therefore necessary to keep them separated. I did this by means of the illustrated trap. The wooden ends have three holes drilled in the center and are grooved along the edges to receive glass sides. Wire, threaded back and forth through the holes and drawn tight, holds the assembly together.

A space, equal to the thickness of a half-dollar, should be left between the lower edges of the sides. Suspend the trap, with the adult fish inside, from a stick laid across the top of the aquarium. The young, when born, fall through the opening at the bottom of the trap, which should be covered with a piece of screen to prevent the adult fish from jumping out.—K. F. Keith, Chicago.

Drying Canvas Work Gloves

Here is a simple, but quick and effective method of drying wet canvas gloves. Tie a string to the cuffs and stuff the gloves with wads of crumpled paper to allow free circulation of the air inside. Then tie them to a support so that they will swing freely in a breeze. In this way, the gloves will keep turning and will dry on both sides in a very short time.

Sunken Floorboards Quickly Raised and Repaired with Pinch Bar and Woodscrew

Easy Method of Repairing Sunken Floorboards

With the use of a pinch bar or a heavy claw hammer and a woodscrew, sunken floorboards can easily be repaired. The screw is driven into the board which is then pried up and secured to the floor by toeing nails into the edges.

Punching Holes in Large Sheets

When it is desired to bind large, single-folded sheets of paper with ribbon or cord, and the small hand punch is too limited for punching the holes, a simple trick will increase its range. Fold the sheets over in the center and take half cuts with the punch along the folded edge. When the sheets are unfolded you will have a round hole of the proper size, and exactly in the center.

☛ An old auto frame with planks bolted to it makes a sturdy raft.

Flushing a Car Radiator with a Water Hose Insures Thorough Removal of Rust and Dirt

Better Method of Flushing Radiator

Before flushing out the water system of your car, use a good grade of commercial rust and dirt solvent. With this solution in the radiator, run the motor until the water is hot, and then drain the entire system. The rust and dirt, now in a more or less fluid state, can be quickly removed by flushing. To do this, remove the lower water connection from the bottom of the radiator and insert the hose as shown, taping the hose nozzle to the radiator connection, to prevent leakage and thereby get the full benefit of the water pressure.

Window Catch Closes Storm Door

By using a window catch on a warped storm door, which does not close entirely, it can be fastened at night so that it really serves its purpose of keeping out the cold. The catch is installed at the point where the door will not close. Part of the catch is screwed to the edge of the door and the other to the door frame, as indicated.

"Poo-Bah"—a Winter Windjammer

In a stiff breeze, the wind-driven sled shown on the opposite page gives thrills of coasting, ice-boating and driving a spirited horse, the sail pulling the sled at the end of a long boom, and the driver manipulating it with a pair of reins. Greatest speed is attained in going with the wind, but a quartering wind will also drive it when the sail is pulled in toward port or starboard, as the case may demand. In slowing down or coming to a stop, the wind can be spilled from the sail by simply turning it parallel to the breeze. Steering is accomplished by the usual method of short sleds, that is, throwing one's weight to one side and dragging a foot, if necessary; manipulating the sail will also help turn in a wide sweep. Select a comparatively short sled for easy maneuvering, and fasten on it by means of cleats a box of the same width. In the center of front and rear, as shown, make slots, $\frac{3}{4}$ in. by 5 in., to carry the boom, which is a piece of $\frac{3}{4}$ by 4-in. by 7 ft. yellow pine, tapering from 4 to 1 in. Notches are made as indicated to engage the slots in the box. Thus the weight of the sail holds the boom in position until it is lifted out. At the small end of the boom, a hook is fastened to support the sail. Make a kite-shaped sail, with two spars of $\frac{3}{4}$ -in. yellow pine tapering from $1\frac{1}{4}$ to $\frac{3}{4}$ in. A light eyebolt holds them together where they cross. Bind the ends with soft wire and in each set a screw with the head extending about $\frac{1}{4}$ in. Stretch a cord over the ends of the spars, with a loop for each, cut your sail to fit with a 1-in. lap, baste it to the cord and then remove for stitching on a sewing machine. Thus the sail can be removed easily, the spars unbolted and the unit carried conveniently when not in use. Unbleached muslin will be satisfactory for the sail; two pieces, 1 by 2 yd. in size being sewed together and then cut to shape. By screwing two blocks to the sides of the forward boom slot, and putting a bolt through them and the unshipped boom, a good towing bar is made and the "Poo-Bah" can be hauled by a car to the frozen lake or pond.

☛ Calcimine brushes easier if $\frac{1}{2}$ pt. of liquid soap is added to each gallon.

"POO-BAH"

for Winter Thrills

Toy Balloon Made of Cellophane Stays in Air Several Days and Travels Long Distances

Homemade Cellophane Balloon Travels Long Distances

Here is a toy balloon that will remain in the air for many days and, with favorable winds, may travel very long distances. The advantage of this balloon is that it is made of transparent cellophane, which allows the sun's rays to pass through it without appreciably expanding the hydrogen gas with which it is filled. The cellophane is cut into gores, 3 in. wide and 18 in. long. One roll of cellophane will make a balloon about the size of a large water ball. In cementing the gores together, it is necessary to hold them on a rounded surface such as a large ball or round vase. Allow the gores to overlap about $\frac{1}{8}$ in. and use collodion for cement. About 10 gores are required to make a sphere. A 1-in. length of rubber tubing is cemented in one gore for inflating. The apparatus to do this consists of a bottle containing about $1\frac{1}{2}$ oz. of sulphuric acid, which is slowly poured into an equal amount of water, whereupon a few pieces of zinc are dropped into the bottle and the latter is closed with a cork fitted with a rubber tube, which leads to a second bottle containing lump quicklime. This removes all moisture from the hydrogen gas that is generated. A tube from the latter bottle connects with the balloon, which is flattened before filling with gas. When filled,

tie or cement the tube so that the gas will not escape. The final operation consists in attaching a sheet of instructions, asking the finder to send notice of the landing of the balloon.

Trouble Shooting in Automobile Ignition Systems

Intermittent missing of a motor is often caused by poor contact between the carbon brush in the distributor cap and the spring on the rotor arm. If the brush is worn off even with, or below, the metal band that holds it in place, there will be a poor contact or none at all. This will cause the engine to fire intermittently, especially when traveling at normal speed. The best remedy is to provide a new distributor cap. If this cannot be done, remove the carbon brush and replace it with one made from an old motor or generator brush, allowing it to project about $\frac{1}{8}$ in. beyond the metal. Scrape the points in the distributor cap with a sharp knife, removing only enough to produce a good contact for the spark. These points need not touch the rotor arm as the high-tension current will readily jump a slight gap. In some cases a small piece of brass or steel can be soldered to the rotor arm to reduce the size of the gap and consequently the resistance to the spark.

Imitation Match Flame for Use When Photographing

When photographing gasoline appliances, a western photographer made a pa-

For Photographic Purposes, a Paper Cut-Out Makes a Realistic Match Flame

per cut-out representing a flame and attached it to a burnt match. This adds a realistic touch to the picture and does not cause a blurred spot like a real flame.

Staining Shingle Roofs With Used Motor Oil

After repairing the roof of my home, I decided to stain it with used motor oil which was cheaply obtained from near-by garages. As a black stain was desired, I mixed a quantity of powdered lampblack with the oil. The roof was gone over thoroughly with this mixture, using a paintbrush, which resulted in a satisfactory and economical job. As it is cheap, the oil may be put on thickly in one coat, or the roof may be given two or three coats, each being allowed to dry before applying the next. This oil paint is an effective protection against rain, as the oil soaks into the shingles and acts as a preservative. For staining new shingles, the oil and lampblack can be mixed in a barrel and the shingles simply dipped into the solution and then set away to dry before use.—C. Illingworth, Vancouver, Can.

Aquarium Forceps Quickly Made from Brass Wire

A pair of wire forceps for use in removing or adjusting plants, stones, and other small objects, in your aquarium is easy to make. Bend a 30 or 40-in. length of $\frac{1}{8}$ -in. brass wire at the center

to form a narrow "U" and hammer a small flat near each end, to allow drilling and the insertion of a copper rivet. Then flatten the ends of the wire to form the jaws.

Trick Box Gives Illusion of Looking through Solid Objects

By using hidden mirrors set at angles, this trick box gives the illusion of looking through an opaque object placed in a compartment which is open at the top.

Built on the Principle of a Periscope, This Box Gives the Impression That Vision Penetrates Solid Objects

Holes are drilled in both sides of this compartment and are covered with mica to give the impression that the line of vision passes through them. Four mirrors, set in a built-in passage as indicated, direct the line of vision from one end of the box to the other, completely around the stone. Two tubes are inserted in the ends of the box, in line with the mica windows and also with the upper mirrors. In use, any object held at the end of the box will be visible through the tube at the other even though a stone or brick is placed in the center compartment.

Rubber Protector on Drill Chuck

When using a small automatic drill on a finished surface, it is a good idea to provide some method of preventing the chuck from marring the surface when it breaks through the work. This can be done by slipping one of the ordinary plumbers' fuller balls of the soft-rubber type, which are used in water faucets, over the drill and against the chuck as shown. This allows the drill to project far enough for ordinary work.

You Can Build

By REGINALD H. CLAUDIUS

PART II—Cylinders, Pumps and Boiler

No. 19 brass escutcheon pins to $\frac{3}{8}$ -in. length, file the heads square and drive into the cylinder heads.

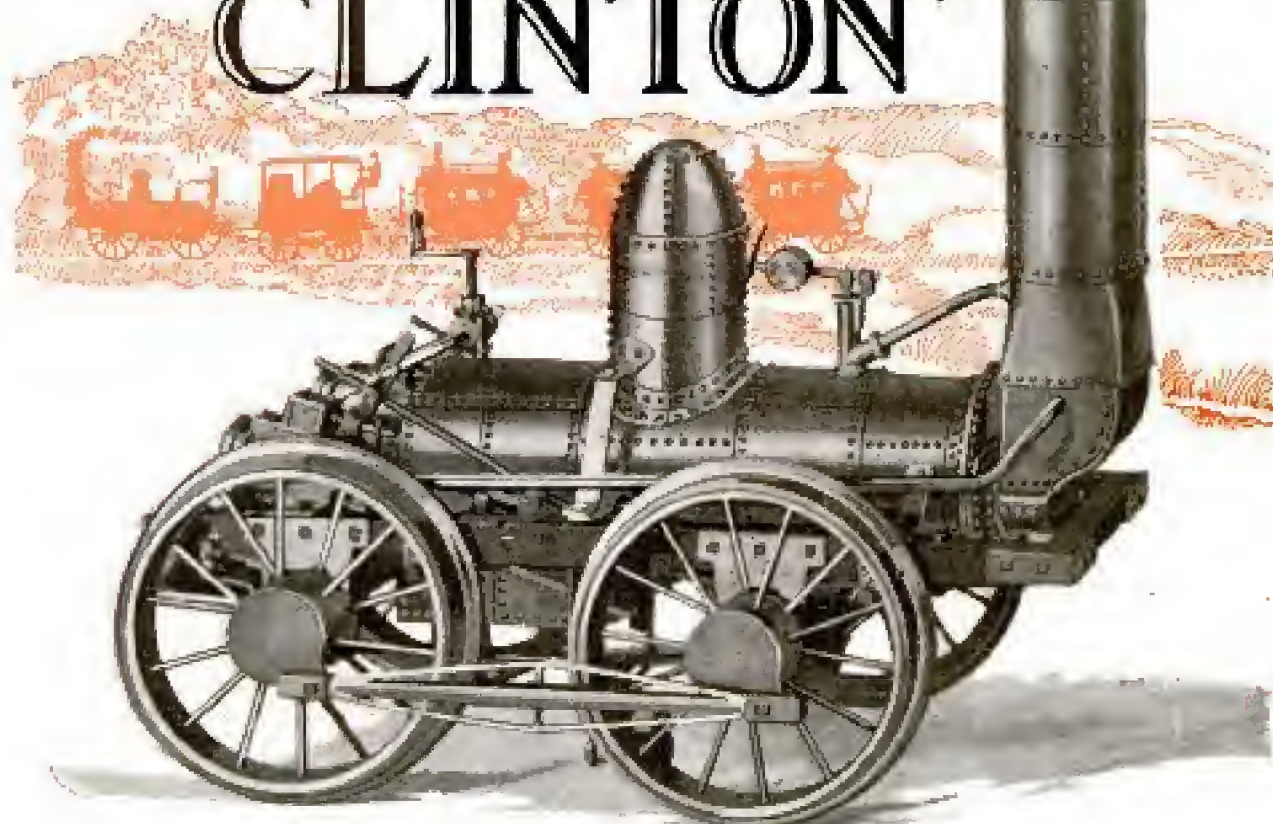

The valve-chest base is next cut and filed from $\frac{1}{8}$ -in. brass, drilled and tapped as indicated, one right, one left, and is sweat-soldered to the cylinder barrel. The valve chest is next shaped and bored as indicated in Fig. 25 and sweat-soldered to the base on each cylinder, the tapped hole in the base and the steam-inlet hole in the chest being placed on the same side.

THE work of building the De Witt Clinton locomotive continues with the construction of the cylinders, the first step of which is detailed in Fig. 25. Turn both cylinder barrels from $\frac{3}{8}$ -in. round brass to the dimensions indicated in the top detail, then cut the parts along the line shown with a jewelers' saw, and locate and drill seven No. 57 holes, equally spaced, in each end. Tighten the work in the lathe chuck and drill a No. 40 hole through the cylinder, stopping the hole before breaking through the opposite end. Then cut

Fig. 26 shows the cylinder brackets, the valve-rod guides and the piston rods, and it should be remembered that the former must be made right and left. The upper left-hand detail of Fig. 26 is given only for the purpose of indicating the dimensions of the two parts, which must be cut separately. Assemble the brackets, right and left as shown, then sweat to the cylinders as in the lower left-hand detail. Drill a No. 42 hole for the exhaust pipe and No. 52 holes through the outside halves of the brackets. Solder a $\frac{3}{16}$ -in. length of $\frac{1}{8}$ -in. outside diameter brass tubing in each valve chest, then cut the valve rod guide $\frac{1}{4}$ in. wide from No. 22 gauge sheet brass and solder to the front end of the cylinder with the No. 47 hole alining with that through the valve chest as in Fig. 27. Use a fine file and a

CLINTON

A detailed illustration of a steam traction engine, likely a portable engine, shown from a side profile. It features a large horizontal boiler, a tall vertical smokestack at the rear, and two large spoked wheels. The engine is positioned in the foreground. In the background, there is a sepia-toned illustration of a steam locomotive pulling a passenger car through a hilly landscape with trees. The word "CLINTON" is written in large, bold, serif capital letters at the top of the image.

The various parts which make up the cylinder crosshead-guide and valve-gear assembly on the left side of the frame, viewed from the front, are shown in Fig. 27. The cylinder assembly is bolted to

the frame through the holes already drilled. All parts are duplicated, left and right, and are made of brass. To insure that the crosshead slides freely in the guide, it will perhaps be necessary to allow $\frac{1}{4}$ in. for clearance between the projecting lugs. After the cylinder is bolted to the frame,

care must be taken, when assembling the crosshead guide, to get the parts properly aligned, or the piston rod will bind. If necessary, file the inner half of the pedestal to properly align the guide. The cylinder and guide assembly must line up with the center line of the crankshaft. This may also require light filing of the

$\frac{1}{8}$ -in. squares of brass and are soldered to a No. 0-80 screw as shown. After soldering, the head of the screw is filed off for clearance. Connect the driving arm to the crosshead with a No. 0-80 screw, with the tapped hole as close as possible to the lower edge, to allow ample clearance for the connecting rod, which is filed from $\frac{1}{8}$ by $\frac{1}{16}$ -in.

parts. Figs. 28, 29 and 30 show the details and assembly of the mechanical water pump located on the left side of the frame, viewing the engine from the front. All parts are made of brass and are assembled as in Fig. 29. The pump cylinder is supported by the left pedestal tie-rod, the $\frac{1}{16}$ -in. wires passing through the rod and into the frame. The wires are soldered to the pump cylinder and to the tie-rod. The bellcrank bearing is centered $\frac{3}{4}$ in. from the center of the crankshaft, and two No. 0-80 screws that hold the bearing are turned up in the wood. The long and short arms of the bellcrank are filed from

brass as in Fig. 31, the end that connects to the crank pin being held by means of a strap as shown. Make the eccentric rods and straps and connect to the valve gear as in Fig. 29.

The boiler shell is first laid out on No. 22 gauge brass and is cut to the form shown in Fig. 36. Then the lines indicating the location of the rivets are laid out with a rule and sharp scribe, the rivet impressions centering approximately $\frac{3}{32}$ in. from the edges. For punching the rivet marks turn a die from $\frac{3}{8}$ -in. steel rod as in Fig. 33, clamp a supporting block to the drill table and drill a $\frac{3}{8}$ -in. hole in the block. Insert the die, then grind the end of a small punch round and to such size that it will fit into the drilled end of the die. Tighten the punch in the drill

chuck, place the work on the die as in the upper right-hand photo, so that the impression will center on the line indicating the location of the rivets. Space the impressions $\frac{3}{4}$ in. apart as nearly as possible, and be careful to follow the line. The fire-box stay bolts are made from No. 19 brass escutcheon

pins driven through No. 57 holes spaced on $\frac{1}{4}$ -in. squares, as indicated in Fig. 36. Cut off the pins and rivet the ends. Make the boiler backhead from $\frac{1}{8}$ -in. flat brass to the dimensions of Fig. 34, rivet the indicated number of No. 19 escutcheon pins through No. 57 holes, and round one edge of the backhead by light filing. Turn a 5-in. length of hardwood to 1-in. diameter, as a form for shaping the boiler shell as indicated in Fig. 35, using two clamps made as shown. In doing this, make sure that the wood form is not less than 1 in. in diameter throughout its length; $\frac{3}{4}$ in. over is permissible. Trim the joining ends of the shell to a close-fitting butt joint, flow on solder, remove the clamps and slip out the form. Then set the backhead in place as in Fig. 32, allowing it to project beyond the end of the shell $\frac{3}{4}$ in. (See Fig. 34.) Hold it in place with clamps and flow solder into the joint from the inside of

the fire box. The plates, which composed the original boiler shell, are best simulated by a band of thin sheet brass, made and applied as in the upper detail of Fig. 37. The rivets are the same size, and the band is placed on the boiler between the short horizontal rows of rivets in the shell. The band is trimmed to fit and the joint soldered parallel to that of the boiler.

The throat plate and throat-plate flange are cut from No. 22 gauge brass and soldered in the position shown. These parts must be trimmed and filed to fit. File the end of the boiler shell square across, and bring the length to $3\frac{15}{16}$ in., then cut a band $\frac{1}{8}$ in. wide from No. 26 gauge brass, punch rivets along a center line and solder this around the end of the shell, the edges flush. Part 2, of Fig. 37, is cut $\frac{1}{8}$ in. wide in the form of a ring and soldered to part 1, then the boiler end, part 3, is soldered to part 2. Though the rivets are indicated

around the edge of part 3, they need only show above the first half of the smoke-box angle, part 4, as in the lower right-hand detail, which gives the complete assembly of parts 1 to 6. The top of the smoke box, part 6, is $\frac{7}{16}$ in. long and slants $\frac{3}{16}$ in. along the length, projecting $\frac{1}{16}$ in. beyond part 5. Application of parts 7 and 8 complete the smoke-box assembly. Part 7 is soldered to part 6, while the clean-out door is held in place with wingnuts made from No. 0-80 screws as shown and turned up in tapped holes in part 7. When assembled, the rivets on parts 1, 2 and 3 should be in the position shown in the lower right-hand detail.

Next is the steam dome, shown in Fig. 42. The shell or body is first cut roughly to shape as in the upper detail, rivets being punched in the position indicated, and is then clamped about a wood form $2\frac{3}{4}$ in. in diameter and the joint soldered. Next, the first half of the angle, shown in the lower detail, is cut $\frac{3}{8}$ in. wide from No. 26 gauge brass, and a row of rivets punched along a center line. The angle is then soldered to the curved end of the shell, and the whole is filed to fit the contour of the boiler. The top of the dome is turned from 1-in. diameter round brass to the form shown in Fig. 42, the top cap being

simulated by a very light shoulder cut. Drill No. 57 holes for a line of rivets about the lower edge of the cap and four equally spaced vertical lines of rivets. Then drive in No. 19 escutcheon pins and solder the top to the shell. The second half of the angle is cut $\frac{3}{16}$ in. wide from No. 26 gauge brass to an oval form, approximately $\frac{1}{4}$ in. larger than the dome, measuring over the first half of the angle. The oval shape is necessary because of the curve of the boiler. Place this part on the

boiler with the forward edge about $\frac{1}{16}$ in. from that of the boiler-shell band. Set the dome over this, locate the parts in the proper position with relation to the boiler, hold firmly in position and flow solder into the joint between the halves of the angle and between the lower half and the boiler. Clean off all excess solder with a fine wire wheel.

Figs. 38, 39 and 40 show the exhaust chamber, exhaust-chamber hood and smokestack. The latter is laid out as in Fig. 40, and as the rivets are smaller than those in the boiler, the die is altered by filing the top flat, center drilling with a No. 55 drill to the same depth, and then turning the top end back to the original form. Alter the punch to suit, and then punch the rivets in the position indicated in Fig. 40. Bend around a hardwood form, turned to $2\frac{3}{4}$ -in. diameter, trim the joint to a close fit and solder. Solder a length of No. 12 brass wire to the top end as in Fig. 39. Assemble the exhaust chamber and hood as in Fig. 38, from which it will be noted that the top of the hood is of circular form to fit the stack, while the lower end fits over the square top of the exhaust chamber. Soldering this is rather

difficult, and the easiest way to assemble the hood is to solder the four parts at the lower edge, which is a lap joint. Then file and bend the parts until the four butt joints fit properly to form the curved top, after which they are easily soldered. File an inside bevel on the lower end of the stack, and bevel the curved top of the hood until the stack fits snugly over it in a tight lap joint. Flow solder in the joint, then file the top of the stack square across and remove all excess solder with a wire wheel. Do not solder the completed stack to the smoke box until the throttle and safety valve are in place.

Next, turn the parts of the throttle valve from brass and fit together as shown. No solder is used on any of the parts. The No. 55 hole through the body of the valve is tapped clear through, and the two parts forming the flanges are turned to a tight fit in the No. 21 hole drilled transversely through the body. The stem is a No. 0-80 screw turned through one end of the handlebar. The head of the screw is then filed off. A short piece, cut from the threaded end of a No. 0-80 screw, is turned

up in the brass handle, and this is tightened into the end of the handlebar. Round the lower face of the body flange to fit the curve of the boiler, drill a No. 52 hole, centering $\frac{3}{16}$ in. from the rear end of the boiler, place the throttle in position and turn up a No. 0-80 screw from the underside. Make the grates and fire door, and solder in the positions shown.

In making the safety valve, follow the dimensions in Fig. 41, soldering to the boiler as shown, the guide for the free end of the weight bar being soldered to the dome. Use fine wire for pins through the No. 60 drill hole in the plunger yoke and bracket, thus allowing the bar to rise and descend. The upper end of the exhaust pipe, leading from the valve to the stack, is fitted with a flange as detailed. Cut the pipe to approximate length from $\frac{3}{16}$ -in. diameter brass wire, solder to the valve and also fit and solder the flange at the upper end. Fit the smokestack to the smoke box (some filing may be necessary) and, after soldering, fit and solder the upper end of the exhaust pipe, leading from the safety valve to the hood, in the position shown.

In assembling the boiler in the frame, follow Fig. 43 and the upper left-hand detail, which show approximate dimensions

of the supporting brackets. It will doubtless be necessary to lightly file the crosshead lugs carrying the piston rods, and also to bend the eccentric rods so that these parts will not bind. The brackets supporting the boiler are cut $\frac{1}{8}$ in. wide and are held in place with No. 0-80 screws turned up in No. 55 holes drilled and tapped through the boiler shell and, at the lower ends, by means of a No. 0-80 screw through the frame as indicated. The heads of the screws holding the brackets to the steam dome are filed to about half the original size for better

appearance. The details and assembly of the globe-valve fitting, the eyebolts and the hand water pump, and also the steam inlet and exhaust pipes are shown in Figs. 43, 44, 45 and 46. These are comparatively simple. The only precaution necessary in fitting the globe valve to the boiler is to make sure that it is far enough forward to insure clearance for the cranks and

ends of the connecting rods. The hand-wheels of the globe valves consist simply of $\frac{1}{2}$ -in. disks, turned from brass and drilled and tapped for a short piece cut from the threaded end of a No. 0-80 screw, which is driven into the disk and soldered. The body of the valve proper is duplicated, and both parts are a drive fit in the No. 30 hole drilled transversely through the fitting. The complete fitting is fastened to the underside of the boiler, as in Fig. 45, with No. 0-80 screws, and is connected to the mechanical and hand water pumps with $\frac{1}{2}$ -in. brass wire in simulation of the original piping. Make and fit the eyebolts, front and rear, and place the hand pump on the left side of the frame to complete the engine.

It will be noted that certain dimensions on the boiler parts are oversize and will require trimming to fit. This has been indicated purposely to avoid waste of material due to the difficulty of cutting parts of the thin sheet metal to exact dimensions with shears. Where a wire is indicated as fitting a drilled hole, it is best to test the drill of the indicated size on a piece of waste stock, as it often happens that, owing to an error in grinding or the means of driving the drill, a given-size hole will turn out off size.

If you cannot purchase No. 0-80 screws, write to Popular Mechanics, and we will furnish them at cost. The De Witt Clinton contest will close Dec. 31, 1932, at 12:00 p. m.

Specimen Holder for Microscopes

Objects can be held under a microscope at the proper position with a fixture made as follows: Push two pin card holders

into a small cork as shown, and insert a piece of clear cellophane in one end and a piece of white paper in the other. With this arrangement, the specimen

can be held at the proper position for the best illumination. The ring on the pin keeps the object from sliding off the cellophane.

This Ventilated Ash Receiver Keeps Your Basement Clean

Dust and fumes from hot ashes can easily be eliminated by the use of a ventilated ash bin in the furnace room. If made of concrete, an old box or crate can be used for a form, which is set in a corner so that the basement walls form two sides of the bin. Or, if desired, it can be built of brick or tile. After the wall has been built up about even with the top of the box, lengths of scrap metal or pipe are laid across the top for reinforcing, small holes being chipped in the wall to support the ends. A stovepipe is set in place in the top before the concrete is poured, 1-in. wood being used on the sides to keep the concrete from running off. After the concrete has set, the box form is burned out and additional lengths of stovepipe, one of which is fitted with a damper, are run to a near-by chimney. When putting ashes in the bin, the damper is left open until the dust and fumes have escaped.

Driving with Car Doors Locked

In large cities, a motorist is often held up when he stops for traffic lights. To prevent such an occurrence, both doors may be kept locked so they cannot be opened from the outside, although easily released from the inside. This precaution not only relieves the motorist's mind but assures him that the car is locked when he leaves it.

Length of Twine Passed through Screweyes Simplifies Drawing of Perspectives on Blackboard

Method of Drawing Perspective on Blackboard

To simplify drawing perspectives on blackboards, tie a small weight to one end of a string passed through two screweyes, located at the vanishing points near the top of the board as shown. In this way, it is only necessary to pull the string down and use it as a guide for drawing the lines which will always be at the correct angle.

Waste Trap for Bench Planer

This planer is set on a bench with open top, and a drawer is provided underneath to catch the shavings, saving unsightly piles of rubbish in the workshop. A box may be put into the drawer, which is

Drawer under Lattice-Topped Bench Provides Receptacle for Catching Shavings from Planer

easier to lift out and dump than the whole drawer.—H. Rossiter Snyder, Guilford, Connecticut.

Distributor Breaker-Point Spring Repaired with Hairpin

If the spring that controls the breaker points in the distributor head of a car breaks while on the road, a repair, that will have enough tension to operate the points until you reach a garage, can be made with a length of stiff wire or a hairpin. Bend one end of the wire around the rotor-pivot post, letting it extend far enough to make contact at the binding post where the broken spring is fastened. Then place a piece of heavy paper between the wire and the distributor housing for insulation. Should the breaker points become badly burned or pitted so that they will not produce a good spark, and no file is available to smooth them down, they can be cleaned sufficiently for the drive home by removing and rubbing them against a rock or other abrasive surface, such as the exhaust manifold.

Practical Substitute for Pulley

While experimenting with the mechanism working a furnace damper, I was in need of a small pulley. The smallest one obtainable was too large. I took the bell crank from an old carburetor and mounted it as shown. This worked nicely, with greater convenience in operation than a pulley.—F. W. Bentley, Jr., Missouri Valley, Ia.

Emergency Measure with Cigaret

As all popular brands are made to a length of $2\frac{3}{4}$ in., a cigaret can be used for measuring when there is no scale at hand. Any short but confusing distance can be measured quite accurately by marking off the cigaret lengths with a pencil.

☛ Mice cannot damage binder canvases that are suspended from the rafters of a shed by means of two barrel hoops.

Ms B P.

INEXPENSIVE BUILT-IN TABLES for YOUR HOME

by Oscar Hansen

ALTHOUGH inexpensive, these built-in tables have beauty of design and construction and are of general utility in the average small home and apartment. Their exact shape and size must be largely determined by the wall space and the size of the

room in which they are to be built, as well as by the fancy of the builder.

In the construction, the only material needed is $\frac{1}{4}$ -in. five-ply veneer, ordinary stock molding, 1 in. wide, and a few 1-in. brass-plated iron portiere poles with fittings. Tables of various designs are shown, some of which have two or three shelves, but the method of building them is essentially the same in all cases. The top and shelves, which may be rectangular or curved, are doweled to a 1-in. back-board which fits between them and is at-

tached to the wall. Lengths of portiere tubing are fitted between the top and the shelves to support them at the front edge. The best way of doing this is to screw wooden plugs into the surfaces and slip the tubing over the plugs, as shown in Fig. 3. Tables may be supported by one or more legs or they can be suspended from the ceiling, tubing and curtain-rod fittings being used for this purpose. If the tables are to be attached to a frame wall, it is a simple matter to drive long wood screws through the back and into the studs behind the plaster, the position of the studs, which are usually 16 in. apart from center to center, being determined

by sounding. If, on the other hand, tables are to be attached to a wall of

top and back, the molding on the edge of the table holding the mirror in place securely.

For finish, tables may be stained and varnished to match the woodwork of the room, and, in this case, the veneer should also be the same kind of wood as the room trimmings.

brick or tile, expansion bolts are needed.

The variety of purposes to which tables lend themselves can be seen from the photos, Fig. 1 showing a suspended writing table, and Fig. 6 a dressing table, built along the same lines as already described, but refined by the addition of a mirror

Another method of finishing is by application of paint, lacquer or quick-drying enamel. In the latter case, a combination of two complementary colors will give a pleasing two-tone effect.

Simple Method of Making Tiny Gears for Models

When making model gears of $\frac{1}{16}$ -in. diameter or less, the task of cutting and spacing the teeth can be simplified by using celluloid and proceeding as follows: First scribe two circles on the celluloid, one of 1-in. diameter and the other to represent the hub, both from the same center, of course. Next, draw lines from the edge of the smaller circle to the larger circle, dividing it into equal parts to represent the centers of the teeth, and finally scribe a third circle to represent the outer edge of the finished gear. After a hole has been drilled through the center, determine the thickness of the teeth and cut away the triangular portions between them. The result will be a tiny hub with

long teeth, which are cut off to proper size and smoothed down with sandpaper. This gives you the finished part ready to color and attach to the model.

Rubber Cup for Mixing Water Colors

right amount of water for this purpose, are easily cleaned, are unbreakable and cost very little.

Small rubber cups such as are used under casters on furniture make good containers for mixing water colors. They hold just the

Paints for Steam Radiators

When used on radiators, paint should be elastic enough to expand and contract with the metal. First remove the old paint and thoroughly clean the radiators. Then apply a priming coat consisting of heavy-paste white lead, 100 lb., linseed oil, 2 gal., pure turpentine, 1 gal., drier, 1 pt., or smaller quantities in the same proportions. This coating should be brushed out and allowed to dry thoroughly before applying a second coat of paint consisting of heavy-paste white lead, 100 lb., flattening oil, 2 gal., turpentine, 2 gal., drier, 1 pt. Allow this coat to dry and apply a third coat mixed as follows: Heavy-paste white lead, 100 lb., pure turpentine, 2 gal., floor varnish, 1 pt., drier, $\frac{1}{2}$ pt. For a glossy finish, use the following: Heavy-paste white lead, 100 lb., flattening oil, $1\frac{1}{2}$ gal., floor varnish, $\frac{3}{4}$ gal. Do not apply any coat sooner than 24 hours after the previous one, and allow the last coat to dry thoroughly before letting steam into the radiator.

Rubber Band Holds Rope on Bail

When using a pail to which a rope must be attached, a rubber band from an old inner tube wrapped around the bail will hold the rope securely in the center and prevent the pail from tipping. Wrap the band around the handle and loop the ends into each other until it is firmly stretched. Then pull up on the ends, slip the end of the rope through them and tie the band to the handle.

Mercury Removes Bullet from Gun

When a bullet becomes lodged in a gun barrel, it can be removed with mercury without any harm to the rifling of the gun. Place the gun in an upright position and pour a teaspoonful of mercury into the muzzle. After a few hours, the mercury will dissolve enough of the bullet to allow it to fall out at the breech.—Warren N. Crane, Brooklyn, N. Y.

Windshield Sprinkler Prevents Dirty Water from Dropping on Finish of Car Body

Hand Sprinkler Cleans Windshield

By filling a bottle with a solution consisting of soapy water and a little vinegar, and fitting it with a grooved cork, as shown in the detail, you can make a sprinkler for cleaning windshields. This will be especially useful to oil-station attendants, as a few "flicks" of the bottle will wet the windshield, which, when wiped and rubbed with a cloth, will be clean and sparkling. The use of the sprinkler also prevents spots of dirty water from dropping on the body finish.

Curtain Rod Protects Saw Teeth

A cheap brass curtain rod of the kind that has a slit along one side can be used as a guard for the teeth of a handsaw when carried in a tool kit. The slit is widened to slip over the saw while the set of the teeth keeps it from coming off. The guard is quickly put on or removed.

Old Brass Curtain Rod Spread at the Seam Provides Guard for Teeth on Saw

Shooting Movies and Stills at the Same Time

It is a comparatively easy matter to take movies and stills at the same time by mounting both cameras on a single wooden base. Plywood is the best to use for the base, as it is strong and will not warp when properly coated with paint or spar varnish. Be sure to fill the edges to prevent any moisture from getting under the veneer. A base, 4 by 14 in. in size, is satisfactory for this purpose. The best method of attaching the cameras is to drill holes through the base, and then drive thumbscrews into the tapped tripod holes in the cameras. A hole is also drilled through the center of the board to receive the tripod screw, a nut and washer being provided on the end of this screw to hold the camera base on the tripod securely. Or, if you desire, a hole can be drilled through the base in line with the tapped tripod-screw hole in one of the cameras, and the screw driven home instead of a thumbscrew. The latter method, however, holds the base off center resulting in poor balance. The photos show how both the

movie and the still cameras mounted on the base can be used in the hands of the operator, or on a tripod, while examples of the work taken simultaneously are shown in the central and upper right-hand photos.

Producing Marble Effects with Paint

Beautiful marble effects can be imitated with paint as follows: For white marble, the first coat, or background, consists of a mixture of heavy-paste white lead, 100 lb., linseed oil, 1½ gal., drier, 1 pt., turpentine, 1½ gal., lampblack, ¼ oz., and French ocher, ¼ oz., or smaller quantities of like proportions. Before this has set, an inner veining effect of light gray may be obtained by blending in a few spots and lines with a mixture composed of lampblack, white lead and thinner. This should be allowed to dry before painting in veins of irregular shape and width with a mixture of lampblack thinned with turpentine, to which is added enough varnish to form a good bond. To help produce a more natural effect, apply a few lines of rust color by using burnt sienna. When the latter has dried, apply a coat of var-

nish, thinned with turpentine, and allow it to harden, after which a coat of pure varnish is put on. This coat is rubbed down with water and fine pumice, and the surface washed and rubbed with rottenstone and oil to give it the luster of polished marble. Two or more coats of thin varnish will give a glossy finish. For a black-marble effect, a coat consisting of heavy-paste white lead, 100 lb., linseed oil, $1\frac{1}{4}$ gal., lampblack, $\frac{1}{4}$ lb., drier, 1 pt., and turpentine, $1\frac{1}{2}$ gal., is applied and allowed to dry. Then a coating of extra-fine lampblack, thinned with pure turpentine, with a varnish binder, is applied. While this is still tacky, paint in a few irregular veins with a thin mixture of lampblack, a little white lead and turpentine. White lead, thinned with equal parts of varnish and turpentine, may be used for the veining.

Spring Tongs for Handling New Photo Plates

As the new panchromatic photo plates must be handled in total darkness, it is a good idea to have a pair of tongs for grasping them. These can be made from a piece of spring brass or clock spring bent to the shape shown. The tongs may be left on the plates while the latter are being developed so that there will be no need of touching them with the fingers.

Spring Tongs Eliminate Necessity of Touching Panchromatic Photo Plates While Developing

Brass can be cleaned with a mixture of salt and vinegar, and rubbing it with olive oil will add a durable finish.

Box Fitted with Wheels and Handles Provides Safe Means for Moving and Storing Windows

Storm Windows Are Safely Stored in Wheeled Box

Storm windows placed in this wheeled box are easily moved to a basement or shed and stored without risk of damage. If possible, get a box that is large enough to hold all the windows, making partitions in it if desired. Attach wheels, handles and legs as shown.—John E. Bostow, Max, North Dakota.

Paper Keeps Powder in Flash Gun When Wind Blows

Have you ever tried to take a flashlight photo with an open-pan flash gun when the wind is blowing the powder out as fast as you pour it into the pan? Here is a simple trick to prevent this trouble. Load the gun in a sheltered place and wrap a single layer of light tissue paper over the powder-filled pan, twisting the ends of the paper loosely together beneath the gun. When firing, hold the gun to one side, as small pieces of burning tissue sometimes fall down. I have used this method for a number of years, and it has never failed.—K. F. Keith, New Orleans, La.

Curvature Cut in Length of Wallboard Provides Template for Making Uniform Picket Fence

Template Helps in Building Uniform Picket Fence

When building a picket fence, a piece of wallboard with one edge cut to the curvature of the fence top between adjacent posts, makes a good template for getting a uniform sweep of the fence. The template is nailed to the edge of a suitable length of 2 by 4-in. stock and placed on the top rail of the fence as shown. If the fence is to be made of only two different lengths of pickets, a guide line for the lower row can be marked on the template with a heavy pencil.

Purity of Water Tested with Sugar

When in doubt as to the purity of water, the following simple test will determine whether or not it is suitable for drinking purposes: Fill a glass tumbler with the suspected water, and add $\frac{1}{2}$ teaspoonful of granulated sugar. Then set the glass in a place where it will be exposed to the sun for about three days. If the water has a dangerous content of germs they will thrive on the sugar and the water will turn a "milky" color, while, if the water is pure, it will remain clear.

Yam Provides Substitute for Green Plants and Flowers

When placed in water, an ordinary sweet potato will grow and produce flowers and graceful vines that make a beautiful indoor decoration for use in the winter months. The most effective container for this purpose is a clear glass bowl with a narrow neck. This holds the potato upright and allows the roots to grow and mass in a fantastic design. The yam flower is fragile and of a rose-colored hue and has a close resemblance to a tropical bloom.

Producing Scenic Backgrounds on Film Headings

Amateur photographers can produce scenic backgrounds on movie-film headings by photographing the scenery through a piece of glass upon which the lettering has been printed. When developed, the film will have the lettering in the foreground and the scenery in the background. Ink for writing on glass can be made by mixing powdered India ink, 1 part, and sodium silicate, 2 parts.

Hole in Bottom of Office Tray Aids in Removing Papers

Difficulty is often experienced in removing papers from an office tray. It can

easily be overcome, however, by drilling a 1-in. hole in the bottom of it, as shown. By poking a finger through this hole, the papers can be raised and lifted out with ease.

Walking sticks and umbrellas, set in a corner on a polished floor, usually have a tendency to slip, but this can be prevented by placing the ends in an ornamental bowl.

Alcohol Restores Original Luster of Shellac

When exposed to humid atmosphere, the alcohol content of shellac absorbs sufficient moisture to precipitate part of the dissolved gum. This condition is readily apparent by the milky color of the work. To overcome the trouble, moisten the work with a little alcohol brushed on with a camel's-hair brush in one direction only. The idea is simply to redissolve the shellac so that it becomes clear. Work gone over in this manner should be rubbed down with a fine grade of powdered pumicestone, or rottenstone and oil, using a soft felt pad.

Old Pistons Used as Shaft Bearings

Discarded auto pistons make inexpensive bearings for light shafting, when rigging up a home workshop. A hole is drilled in the top of the piston which is then bolted in position. Holes also may be drilled through the bushings for oiling. If the particular size of piston required is not available, it is a simple matter to bush the bearing. The drawing shows a bench grinder, having an old piston for the shaft bearing. A collar is set on the shaft between the bushings and washers added to take up end play.

Leaks in Metal Containers Repaired with Tinfoil

For an emergency repair of leaky metal containers, take a piece of tinfoil from a cigaret or tobacco package and twist it into a light roll. Insert it through the hole in the container and press both ends of the foil firmly against each side, which will plug up the hole until a permanent repair can be made.

When clipping photos to manuscripts, a small strip of celluloid bent double and placed under the clip protects the finish of the photos.

Attached to a Built-In Cupboard, This Step Provides Easy Means of Reaching Upper Shelves

Step Aids in Reaching Upper Shelves of High Cupboard

Permanently attached between the lower drawers by means of two iron brackets, a step will be useful in reaching the upper shelves of a tall cupboard. A 6-in. step does not project far enough to interfere with passage, nor will it prevent opening of the drawers.

Wedges for Tool Handles

The wooden parts of a spring-type clothespin make excellent wedges for tightening tool handles and hammer heads. Be sure to get a clothespin having hardwood parts, as these can readily be driven into place with little danger of breaking and splitting, which may happen if soft wood is used.

WITH this air-propelled speedster you will enjoy the exhilarating tang of wintry air while traveling at high speed over ice and snow. The frame is built up of two pieces of 2 by 4-in. stock and a few pieces of white oak or other hardwood, as shown in Fig. 1. Figs. 2 to 7 cover the constructional details. The curved strip of 1 by 2-in. ash, hickory or white oak, which extends across each side frame, can be fitted without steaming by making three saw cuts equally spaced in a distance of about 2 ft. from one end. Clamps should be used to hold the approximate curve, as shown in Fig. 6, while you screw the strip into position. Fig. 7 shows the finished framework ready for the motor installation.

The transmission case will require a few minor changes. Knock the case down, retaining only the shell, the main shaft and the two bearings and grease retainers fitting the shaft. The old shaft is not used; but you must have a machine shop make a new shaft, as shown in Fig. 9, the central portion of which duplicates the central portion of the discarded shaft. The new shaft will be longer so that it will take

Ice Speedster

a large sprocket. Fig. 10 gives a good idea how the case is reassembled. Notice that one large gear containing the roller bearing has been retained, but, as a whole, the unit is now simply a shell with the new shaft incased inside and running on the one ball race and the one thrust bearing, which composed the original fittings. A 48-tooth motorcycle sprocket is fitted to the end of the shaft having the smallest diameter. As the hole in this sprocket is somewhat larger than the shaft, it will be necessary to fit a new opening. This can be easily done by taking two of the small gears that came out of the transmission case and having one welded on either side of the sprocket. Both ends of the shaft are milled for a key, and nuts with S.A.E. threads are re-

quired. With the large sprocket properly keyed and cottered to the end of the shaft, the transmission case can be mounted in place as indicated in Fig. 11, angle iron being used for bracing. Convenient bolt holes on the case make the fitting quite simple. The short but important brace, which extends directly across the case and fastens to the two long supports, should be made from $\frac{3}{4}$ by 1-in. stock to obtain sufficient rigidity. One essential thing must be borne in mind throughout the fitting of the motor and case, viz., that

the motor is not mounted perfectly plumb, but sits at a 2° angle, the top of the motor and the top of the case being inclined that much toward the rear. This slight angle gives the propeller a slight lifting power necessary to offset the weight of the motor at the extreme rear.

Fig. 13 shows the other

side of the motor, with various fittings in place. The 4-gal. gas tank is held by metal straps to suitable crossbars screwed to the framework, and a storage battery is likewise fitted. Gas feed is provided by an "autopulse" which pumps the fuel to the carburetor. A 1-gal. paint can serves for an oil tank and is strapped to the seat back, which is to go on later. Lengths of galvanized-iron pipe connect the two exhaust ports to a central pipe, which is carried out through a hole drilled in the frame endpiece. Ignition and gas controls are carried up alongside the frame to the forward end of the craft.

So much for the motor arrangement.

The next thing to do is to put in the flooring, which consists of 4 1/2-in. strips of wood, cut to fit and nailed in place as shown in Fig. 14. A square opening should be left at the forward end to allow for the fitting of the steering column. Obviously, the steering control must be of sturdy construction, good spring action and simplicity. These essentials are incorporated into the stem shown in Fig. 15. The main block is of white oak drilled lengthwise to

take a 3/4-in. steel shaft. The wedge-shaped piece of oak, which supports the runner, is fastened to the main block with two heavy flat-iron straps, that also serve to hold the springs in place. The tiller arm, of 3/8-in. iron rod, is fitted through the wedge-shaped block and is held in place with a countersunk nut. The runner itself is a straight-grained length of 6 by 1-in. white ash, shaped to a suitable ski pattern and bent up about 6 in. at the forward end. It will be necessary to steam and soak the piece in hot water for some time in order to make this bend possible. A 26-in. length of 2 by 6-in. stock is fitted over the runner to take the spring bolts. For plain snow travel, the ski itself is sufficient, but if the speedster is to be used on ice, both the front and rear

runners must be fitted with $\frac{1}{2}$ -in. square or round iron stock, filed down to a sharp edge. This is fitted the full length of the ski, being held in place with countersunk screws. While the job of filing these runners presents somewhat of a hard task, it should not be slighted, as safe control from sidedrift on smooth ice is impossible without the biting edge of the metal strips. Fig. 16 shows the forward runner fitted in place. The steel rod fits through a hole drilled in the flooring, the unit riding on a large washer. A leaf from a Ford rear spring holds the block at the top to the frame, while a longitudinal brace extends from the shaft end to the brace immediately behind the forward endpieces. Steering is accomplished by the simple straight tiller arrangement in Fig. 17, which shows a top view. Flexible hemp-covered wire, $\frac{3}{16}$ in. thick, is used in con-

nection with a drum steering device fashioned from an old Ford steering wheel. It is fitted through the dashboard which should be previously cut and attached to the frame. The dash may be of almost any shape to accommodate the particular style of steering post and instrument controls selected, but it should stop $\frac{1}{8}$ in. short of the side of the frame on either side, as shown in Fig. 18, to allow space for the fitting of the coaming strips which are to go on later.

The rear runners are 5 ft. long by 6 in. wide and parallel to the center line of the craft, being held 46 in. apart (inside measurement) by two Ford rear springs, as shown in Fig. 19. A central bolt and long U-bolts serve to hold each set of springs to the 2 by 6-in. frame members. Short 2 by 4-in. blocks are fitted to the skis to take the ends of the springs, which are rolled flat and drilled to take the required bolts. Propeller construction and other details will be described in the March issue.

Adjustable Mirror Is Handy for Shaving or Useful on Ladies' Dressing Table

Double Mirror for Use in Shaving

Two mirrors hinged together serve the purpose of a three-piece mirror, often used for shaving, to show both sides of the face as well as the front. Remove the frame from one edge of each mirror and then hinge the top and bottom pieces of both together as shown. If the hinges work fairly hard, the mirrors can be adjusted and hung on a wall.—A. H. Waychoff, Phoenix, Ariz.

Phonograph Aids in Striping Small Circular Articles

Having a number of flowerpots to stripe for a decorative display, a window trimmer used a phonograph to rotate them while the paintbrush was held against the outer surface. By using a yardstick for

Stripes Quickly Painted on Small Circular Articles by Rotating Them with a Phonograph

a guide and a steady rest, it was an easy matter to make neat and accurate stripes around the pots.

Ice-Boat Runners from Steel Fence Posts and Old Skis

Ice-boat runners can be made from old skis and T-shaped steel fence posts. Cut the posts to 3-ft. lengths and bend one end slightly upward, to fit the ski, which should be cut down to the same length as the runner. As the posts are perforated, they are easily bolted to the skis. Drill holes through the skis about every 6 or 8 in., staggering the holes to avoid weakening the wood. Finish the job by grinding the edge of the runners in a manner similar to that of skate sharpening, straight-edge or hollow-ground. If old skis are not available, pine boards may be bent to the desired shape by steaming or soaking them in hot water and then placing them in a form until dry. Keep the runners sharp by occasionally touching them up with a file.

Spacer Helps in Saw Filing

Teeth can be accurately filed on an old saw by using the illustrated spacer. It is made from a piece of flat steel which

is bent at right angles. One end is notched to fit over the teeth, while the other end is beveled to the proper angle to guide the file.—Chas. H. Willey, Concord, N. H.

Extension Spout on Can Prevents Waste of Gasoline

Motorists, who have run out of gasoline along the road, know the difficulty of pouring gasoline into the tank from the emergency cans furnished by the service stations. To overcome this trouble, solder a 4-in. length of copper tubing to the top of a 1-gal. can that can easily be stored in the car, and slip a section of rubber hose over the tubing. In this way, you will have an emergency can with a flexible spout that will enable you to pour gasoline into the tank without waste.

Ball-Bearing SHAPER

made from SCRAP PARTS

by R.E. MYERS

HERE is a cheap shaper that any home-workshop owner can readily build from an old auto-generator shell and a few pieces of wood, including a piece of plywood to serve as a table. The spindle, Fig. 5, is the only machined part and this must be turned down to fit the ball bearings of the generator shell and also the shaper head to be used, the latter being obtainable from manufacturers of small shapers.

After getting an old generator (the one shown was taken from a junked Ford), the armature and the brush holders are carefully removed, and a portion of the side is then cut out with a cold chisel to receive the belt, which is slipped over a small pulley fitting the spindle. Four $\frac{1}{4}$ -in. holes, equally spaced, are drilled through the bottom, about $\frac{3}{8}$ in. from the outside edge, to accommodate $1\frac{1}{2}$ -in. bolts, with which it is attached to a 9 by 9 by $\frac{3}{4}$ -in. block. Another similar block is bolted to the top. Be sure to countersink the holes in these blocks to receive the bolt heads, and also drill holes for the spindle. It should be noticed that a boss is turned on the spindle to rest on the top generator bearing which holds the shaft, while a collar is securely attached to the shaft directly under the upper bearing, to prevent upward movement of the shaft, al-

Shaper heads Heston & Anderson
 601 Western Ave
 POPULAR MECHANICS
 Fairfield, Iowa

334

also spanning collar & order

or in the table, as indicated in Figs. 6 and 7. It is best to bolt or screw the lower block of the shaper to the workbench top, to which an electric motor is also attached as shown in Fig. 1. A good cutting speed ranges from 5,000 to 6,000 r.p.m., and this may be obtained by providing pulleys of the correct size. The calculation of pulley sizes is made by applying the following rule. The speed of the motor, multiplied by the size of the motor pulley, is equal to the speed of the shaper, multiplied by the size of the shaper pulley. Thus, if the motor speed is 1,750 r.p.m., which is quite common, and a 3-in. pulley is used on it, with a 1-in. pulley on the shaper spindle, the speed of the latter will be 5,250 r.p.m. The direction of the cutter with relation to the work is shown, in Fig. 2. In use with a wing-shaped cutter, it is possible to

though this detail is not shown in the drawings. In this way the vertical play of the spindle will be reduced to a minimum. If the shaft is a drive fit in the inner race of the bearing, no collar is needed to prevent vertical play. A circular fence, a washer and a nut are provided to fit the spindle as shown in the lower details of the photo. If you have no lathe to turn down the shaft, the work can be done at any machine shop.

The plywood table is then fixed to the upper block with bolts that are long enough to allow the insertion of two wooden wedges, which are used to raise

vary the shape of the molding by tilting the table with one wedge, as already mentioned. In doing this, however, a straight fence must be used to obtain an accurate, uniform cut, and the work must be run in a perfectly horizontal plane with relation to the cutter.

Water Shrinks Leather Belt

As an emergency measure against belt slippage soak it in a pail of water for 15 minutes. This causes it to shrink, but affords but temporary relief; so, use only when you have no belt dressing.

Scaffold Horses for Painters Are Adjustable

Painters and others who use scaffolds can work at any convenient height with these adjustable horses. Their construction is clearly shown in the photos, the top of each horse being made up of two pieces of 1-in. stock, spaced to allow a third piece of the same thickness to slide between them. The movable part of the horse consists of two vertical members, or legs, and a crosspiece, all three being of hardwood as they will be subjected to considerable strain. A row of staggered holes are drilled through the legs, to accommodate a heavy spike which holds them up at any desired height. It should also be noted that additional bracing for the legs is provided on the horse in the form of pockets, into which the legs slide, in

With a Couple of These Adjustable Horses, Scaffolding Can Be Quickly Raised to the Most Convenient Working Height

order to prevent sideplay. A couple of these horses on the job will save much time in erecting scaffolding and the workers will find them a great convenience.

A Rubber Brush to Use in Acids

To make a brush for use in any kind of acid, take a 4 by 3-in. strip of inner tube and cut one end with a pair of scissors as shown. Roll this on a stick and bind it tightly with a rubber thong, slipping the acid-jar cover over the handle. To pre-

Strip of Inner Tube, Cut at One End, Makes Brush for Applying Acids

vent the bottle from tipping over, serrate a circular piece of tin and shape it as shown to form a base for the bottle.

Helpful Hints for Printers

To avoid blurring a printed sheet, make a finger stall of sandpaper, and use it on the large finger of the left hand to remove the sheets from the press. In building up the tympan on a press for an envelope job, slip a piece of blotting paper under the draw sheet. In this case, a cut-out is unnecessary, as the soft pad formed by the blotting paper will let the folds of the envelope settle enough to make the impression equal. A little jewelers' wax rubbed into the corners of a rule job will seal them so that it will be impossible to detect the joint. If rubber bands are wrapped around the "grippers" when printing a perforated job, the sheet will not pull off with the form.

Brakes Hinged to Rear End of Runners Hold Sled on Hills While Horses Rest

Brakes for Heavily Loaded Sleds

When pulling a heavily loaded sled uphill, these brakes are effective in holding the load while the horses are resting. They are made from two pieces of heavy iron, 10 in. long, shaped as shown in the detail and hinged to the rear end of the runners, holes being tapped in the iron for machine screws with which they are fastened to the hinge. The brakes should be mounted so that the points extend below the runner in order to afford a good grip. When not needed, they are turned back over the runner.

Humidity in Incubator Maintained with Moistened Pads

It is well known that a proper degree of humidity must be maintained in the egg chamber of an incubator. To do this, make several pads, 1 in. thick, by wrapping burlap around a shingle, 3 or 4 in. wide and from 6 to 12 in. long. Moisten these pads with warm water and hang them in the incubator, above the egg trays and under the radiator pipes, on hooks so that they can be taken out for remoistening when necessary. The pads have this advantage over the usual method of using wet sand or a pan of water set in the bottom of the incubator, that the moistened air is formed above the eggs. As humid

air is heavier than the dry air, it moves toward the bottom and passes around the eggs, thus providing a continuous circulation of moist air, whereas with wet sand or a pan of water, it remains at the bottom and does not circulate.

Flatiron Helps Remove Wallpaper

When wallpaper cannot be easily removed by the usual methods, moisten it with a sponge soaked in water and run a hot flatiron over it. This generates steam and quickly softens the paste. Painting should never be done over paper except in the case of heavy embossed papers that are glued to the wall. It should be remembered, however, that some cities have a fire law prohibiting this practice.

This Portable Workbench Is Clamped to Wall Studs

For those doing work in the garage occasionally a portable bench that can be clamped to the studs is useful. Brackets are cut from 2-in. stock and nailed near the ends of the bench top. A recess is then formed at the lower end of each bracket to receive a length of 2 by 4-in. stock, which serves as a support against the studs, and heavy C-clamps are bolted to the bench top near the back to enable attachment.

Portable Workbench for the Garage Fastened Rigidly to Wall Studs with Heavy C-Clamps

Hints for Operating High-Speed Bench Lathes

When stopping a high-speed bench lathe, the operator often checks the speed by laying his hand on the tightening wheel at the rear, putting a strain on the fine threads of the split chuck, which will in time enlarge them sufficiently to cause unnecessary wear and affect the accuracy of the lathe. If the hand is used to check the speed, it should be placed on the cone pulley. Pushing a tool against the cone while the lathe is in motion, will wear a groove in the cone. When cutting steel, it is good practice to place a piece of cloth or cardboard over the tool ways to catch the fine chips, so that they will not work in under the tool carriage and cause wear on the ways.

An Inexpensive Hydraulic Ram

Built from fittings easily obtainable, this hydraulic ram delivers a large quantity of water. The construction is clearly shown. No dimensions are given as the ram can be

made in any desired size. In starting the ram, open the back-pressure valve sufficiently to allow the water to escape freely so there is force enough to lift and close the valve quickly. This will cause the water to open the check valve, allowing the excess pressure to escape into the air chamber and thence into the delivery pipe. If the back-pressure valve fails to open after a while, open it by pressing down the lever a few times, then by adjusting the weight A properly, and the ram should operate without further attention. It should be located 3 or 4 ft. below the source of the supply, which should be kept free of any debris that would tend to prevent the valve from closing.

☛ Soap moistened with water and rubbed over a small piece of metal imbedded in the flesh will often help remove it.

Glass Shield over Emery Wheel Allows Clear Vision without Getting Dust into the Eyes

Headlight Lens on Emery Wheel Protects Eyes

Mounted on the guard of an emery wheel by means of suitable brackets, the rim and a clear lens of an old auto headlight serve as a good dust shield for the eyes. The glass enables the operator to watch the work closely without fear of emery particles getting into his eyes, which involves the danger of losing one's sight.—Donald MacDonald, Salt Lake City, Utah.

Scriber Block with Wide Range of Height Adjustments

Here is a scriber block, having a wide range of height adjustments, that can be made in a short time. A length of flat iron is bent and screwed to a wooden base as shown. A clamp screw is then turned out on a lathe and fitted with a wingnut

on one end, while the other end is drilled to receive the scriber. Cold-rolled stock is used to turn out the scriber.

Holder Carries Steel Wedges Safely and Prevents Their Being Lost

Carrier for Wood-Splitting Wedges Slung over Worker's Shoulder

This holder for wood-splitting wedges is useful around the farm for carrying them about and will also prevent them from being mislaid or lost. It is made of 1-in. wood, 18 by 10 in. in size, with suitable lengths of strap iron, formed to fit the wedges, screwed on as shown. A shoulder strap, made from two lengths of leather, one long and one short, is nailed to the edges of the board and fitted with a harness snap and a ring for easy removal.—J. R. Koontz, Bremen, Ind.

Easy Way of Handling Steel Wool

Steel wool can be handled with greater ease and without cramping the fingers, when it is necessary to apply pressure, by wrapping it around

a large cork as shown. Use a rag to prevent the fine particles from getting into your skin.

Abrasive Dust on Belts Wears Away Pulleys

Belts that are run in places where the air is full of abrasive dust will wear away the surface of the pulleys, especially at the crown. Although it is general practice to run the belts with the slack side on top, it is a good idea to run them with the tight side on top. In this way the flap or vibration of the belt will tend to shake off the dust, thus preventing it from being carried around the pulleys. The advantage gained by having the slack side on top of the pulleys is offset by the longer belt and pulley life.

Improving Toolmakers' Dividers

In order to make the points of my dividers more effective in scribing, I shortened the legs to add the necessary stiffness, and heated and bent them so the points would touch each other when brought together. Then, I filed the inside of the legs so they were flat and parallel to each other when spread about $\frac{1}{4}$ in. apart, making a slight angle when brought together. Finally, I ground the outer edges to an angle slightly less than 60 degrees. The points, now about the same angle as the point of the center punch, enabled me to insert one leg in the punch mark while the other cut a neat circle in the metal.—D. W. Patton, Decatur, Ill.

Imitation Ground-Glass Paint

A paint for imitating ground glass can be made by rubbing down zinc oxide with linseed oil to a consistency of thick cream. It should be applied in a thin coat and stippled with a stiff brush. This makes a novel finish for walls.

Making Accurate DOVETAIL JOINTS

By W. Clyde Lammey

IT is comparatively easy to cut accurate-fitting dovetail joints by hand. A template, as shown in Figs. 1 and 2, fitted with suitable guide blocks, is first made in order to obtain uniformity. The dimensions given here are intended for drawer fronts $\frac{1}{2}$ in. thick, as can be seen from the location of the top guide block. The second guide stop is tacked to the opposite side of the template, with one edge flush with the ends of the sockets, so that the same template can be used in laying out both pins and sockets. The template must be cut to the same length as

the width of the drawer front, and the dovetail sockets must be laid out with care, or the joint will not fit.

After the pins and sockets have been marked off on both the drawer side and front, a guide line is scored across the inside face of the drawer front with a marking gauge, set to $\frac{3}{8}$ in., and the same is done on the inside face of the drawer side with the gauge set to $\frac{7}{16}$ in. Next, a $\frac{3}{8}$ -in. hole is bored to a depth of $\frac{3}{4}$ in. in all the sockets, as shown in the upper right-hand detail of Fig. 4. A $\frac{7}{16}$ -in. hole is then bored through the drawer side, the hole being centered in the waste that is to be removed between pins. This done, the remainder

FIG. 6

of the waste is easily and quickly chipped out with a sharp butt chisel. The projections between the pins on the template, as indicated in Fig. 2, are wider than those on a machine-made dovetail. In handwork, this additional stock tends to prevent chipping. The size and the angles of the pins and sockets may be varied slightly according to the size of the work. On some types of dovetail work, the template will serve only for marking out the sockets, and the pins may then be laid out from the sockets with the jig shown in the lower-left detail of Fig. 4. A sharp-pointed scribe is used to mark the location of the pins to be cut on the ends of the drawer sides, as in Fig. 1. A jig for cutting the sockets by means of a power-driven mortising machine is shown in Figs. 3, 6 and 7, and the completed joint in Fig. 5. A guide bar of $1\frac{1}{4}$ -in. hardwood is made as in Fig. 3, and is slotted for a $\frac{1}{4}$ -in. bolt. A 10 or 12-in. scale, such as part of a discarded yardstick, is ripped to $\frac{1}{2}$ -in. width and set into a $\frac{1}{2}$ -in. groove cut in the top edge of the guide. A sliding stop is then made and attached to the guide by means of a $\frac{1}{4}$ -in. bolt and wingnut, the bolt sliding in the slot cut in the guide. A standard dovetail cutter, with $\frac{1}{2}$ -in. shank, is tightened in the chuck, and a line, measur-

ing $\frac{1}{2}$ in. from the end of the scale, is scored across the inner face of the guide, which is then bolted to the machine table, so that the line will coincide with the vertical center line of the dovetail bit. The stop is moved forward until the end is exactly even with the end of the scale and is locked by the wingnut. Then the machine table is moved forward and locked, to bring the cutter in position to cut the full-sized socket. The stock to be dovetailed is set on end above the cutter, with one edge against the stop as in Fig. 7. In this position it is lowered very slowly onto the

revolving cutter, allowing the cut to progress until the end of the stock rests on the machine table, after which it is carefully lifted clear, the stop moved 1 in. to the left and the operation repeated. In doing this, it is assumed that the cutter is the same size as the dovetail template in Fig. 2. The dimensions of the guide, in Fig. 3, are only approximate, and some slight alterations may be necessary to fit the machine at hand. To aid the cutter in removing the waste, holes may be bored, as in Figs. 3 and 6, in the end.

Making Exterior Paint White

When a mixture of white lead and linseed oil does not give a suitable white color for exterior paint, add a little raw sienna. This tends to neutralize the yellow color of linseed oil, and when the painting has bleached, will produce a comparatively cold-white color.

Small Lamp Illuminates Work Without Glare

Bell-Ringing Transformer Supplies Current for Auto-Dash Lamp to Illuminate Places Hard to Reach

Here's a good method of getting a concentrated light in some remote part of machinery, in a deep bored hole or a pipe. Another application of the idea is on the table of power-driven machines, to throw light on the work. All you need is a small auto-dash lamp, a socket for it, a suitable length of lampcord and a bell-ringing transformer to step the 110-volt house-lighting current down to the 6 volts necessary for the operation of the lamp. If desired, you can mount the lamp and socket on the end of a long stick to reach into places otherwise difficult to illuminate. The wiring of the transformer socket and lamp is indicated in the left-hand photo, while that on the right shows how the same idea can be used to light the ta-

ble of a handsaw. In the latter case, an old auto spotlight and the transformer were both bolted to the machine frame, and the lamp adjusted to throw the light where it was needed. When using a larger lamp than an auto-dash lamp, it may be necessary to get a transformer that delivers more current than that supplied by many bell-ringing transformers. The advantage of using a small lamp is that the troublesome glare of a large lamp hanging in front of you is eliminated.

Rubber Pad Improves Sandpaper Block

A pad of sponge rubber cemented to the bottom of a sandpaper block gives it a resiliency desired for smoothing uneven surfaces. Two wooden blocks, 4 in. square,

one cut from $\frac{3}{4}$ -in. hardwood and the other from $\frac{1}{4}$ -in. plywood, make up the sander. After clamping the blocks together, drill and countersink two holes through them, from the

plywood side, for small bolts, which should project far enough to take wingnuts. After

the nuts have been tightened, remove the clamps and cement the rubber pad to the plywood block. In use, the sandpaper is placed on the rubber bottom and clamped between the blocks.

Brazing Extensions on Drills

Tobin bronze is superior to other metals for brazing extensions on drills when a greater length is required. The preparations are the same as for brazing with steel, that is, apply the bronze, grind or file off the surplus material and polish with fine emery cloth. Tobin bronze will give greater strength, due to its lower melting temperature, which does not injure the temper of the drill nor will it cause the drill to break.

Plywood Case That
Glaziers Will Find
Handy for Carrying
Large Panes of
Glass

Carrier for Large Panes of Glass

Hinged together by gluing a strip of canvas across the bottom, two pieces of plywood will make a good carrying case for large panes of glass. Before gluing on the strip, place a third piece of plywood between the sides, removing it after the glue has dried. This will provide sufficient space to accommodate several panes. Clamping the pieces together and cutting the handholes will finish the job.

Hints on Lapping Fine Work

Fine lapping can be done as follows: Sift a tablespoonful of emery flour into a glass tumbler, filled with a good grade of lard oil, and allow this to set for a few hours, when the coarser grains will have settled to the bottom of the glass. Then pour off the oil, which will be charged with fine emery particles, and apply it to the lap, a drop at a time. This will produce a bright and fine finish. Loose emery powder should not be added to the surface, as it will roll around and prevent contact of the lapping plates, resulting in a scratchy finish. When doing fine cylindrical grinding or lapping, where the wheel must just touch the work, a good method of telling when both are in contact is to place the blade of a screwdriver

on the tailstock and then hold the ear close to the handle. When both are in contact, the vibration will be transmitted to the ear. A sound magnifier of some kind should be used, as otherwise one cannot watch for sparks which would mean too close a contact for very fine work.

Spindle Sander Has Flexible Shaft

For edge-sanding irregular work, an efficient spindle sander can be made from a table, a small sand drum, a length of flexible shafting and a $\frac{1}{4}$ -hp. motor. Bore a hole in the center of the table top just large enough to admit the drum. From $1\frac{1}{4}$ -in. hard-maple stock cut a 4 by 6-in. block, and from 1-in. stock a triangular brace. Screw these parts together as shown. Drill the block to receive two $\frac{1}{4}$ -in. iron rods, 7 in. long, bent to form a hook at one end and threaded for wingnuts at the other. Drill and saw out a slot as shown and also drill and slot a 4 by 5-in. block of $\frac{1}{2}$ -in. stock to correspond with the hole and slot in the 4 by 6-in. piece. Attach the flexible shaft by means of the hooked rods and wingnuts to the block assembly and tighten the sanding drum in the chuck, after which the drum is inserted through the hole in the table from the underside and the whole is fastened securely with heavy screws countersunk in the table top and projecting into both brace and block. Connect the end of the flexible shaft to the motor mounted under the table.

Inexpensive Spindle Sander with Flexible Shaft for
Edge-Sanding Curved and Irregular Work

Fan Aids in Printing Large Sheets

When printing large sheets on a self-feeding job press, it was found that they did not settle quickly enough to be flat on the table when the impression was made. To overcome this trouble, a small electric fan was suspended above the press so that the current of air would force the sheet into place, thus avoiding crumpling in the swing of the press.

Repairs for Worn or Broken Stuffing-Gland Seat

The stuffing glands on pistons of steam engines or compressors are frequently worn to the point where the packing will push through and cause constant trouble. To prevent this, split a lead ring of the

proper size, fit it over the piston rod and drive it up tight against the seat. This will effectively stop the leak and will cause no wear on the rod. If wrenching on the stuffing gland has fractured the seat, make a brass sleeve, with an inner and outer flange as shown in the lower detail. Place a ring of packing under the rear of the outside flange and the rod packing inside as usual. Tightening the gland will then make both packings tight. While it is possible to split the sleeve and assemble it without dismantling the seat, a better packing job will result if a solid ring is used.

Reading Meter with Broken Needle

Difficulty experienced in reading a meter that has a broken needle can be overcome by holding a piece of celluloid on which a narrow line has been painted, in front of the dial, against the glass with the line over the remaining portion of the needle. The line will then point to the correct reading on the meter.

Can with Roll of Burlap Oils Tools without Waste of Lubricant

Handy Lubricator for Your Tools

Here is a can for oiling your tools that will not waste any of the lubricant. Take an oilcan, remove a portion of the spout and to this solder a small tin can, which has been cut in half. Ribbon burlap, which acts as a sponge to prevent the oil from feeding too fast, is rolled to fit snugly inside of the can and to project about $\frac{1}{8}$ in. beyond its edge.

Emergency Square Easily Formed from Folding Rule

With slight alteration, the first three sections of a folding rule can be used as an emergency square. The first section of the rule is folded as shown and squared with the third section and a small bolt is then fitted into a hole drilled through the crossing sections to hold them in place. It takes only a few seconds to form a square in this way and if carefully made, accurate results are assured.

❏ Never keep a gasoline torch more than three-quarters full, and it will be found that the torch will last much longer without need of repairs.

no blueprints. 5/18/32

FROM JUNKPILE TO

CAPABLE of pulling any two-horse load with ease, at good speed and nominal gas consumption, this homemade tractor, made from junk automobile parts, costs only about \$50 to build. Although a low hitch is provided on the rear-axle housing, the high hitch, also shown, is safe for most loads, as it was found that, with the tractor anchored, in several tests to determine its turn-over tendency, the forward wheels lifted 15 in. but no more. To insure a more efficient cooling and lubricating system than that provided on a Ford model-T motor, which is used in this tractor, a water pump and an oil pump may be added, but these details are left entirely to the discretion of the builder.

Starting out, you will need an old Ford passenger car. If you already have one, well and good; if not, your local junkyard or wrecking establishment will supply one at low cost. Stripped of unnecessary parts, the car will take on somewhat the appearance of Fig. 2. From this picture, you can readily see that the car purchase should be made with an eye to a good radiator, a fair motor and an unsprung chassis. The front-wheel unit, too, although not

TRACTOR^{FOR} FIFTY DOLLARS

With the chassis stripped, the first job is to install the new shaft. This consists of a number of pieces, including a Chevrolet transmission to step up the power supplied by the Ford motor, as shown in Figs. 3 and 4. Start building up the shaft by fitting a rear-half universal housing from a Chevrolet over the Ford universal. As can be seen in Fig. 1, the holes must be enlarged a little with a rat-tail file in order to get a neat fit. The Chevrolet transmission comes next, which must be partly disassembled, as

in Fig. 3, in order to remove the front main driveshaft. This shaft is to be taken to a machine shop and tooled down slightly to fit within the Ford universal. The re-assembled transmission is shown in Fig. 5. This sketch shows a 1-in. steel collar, which is fitted to the transmission by means of three $\frac{3}{8}$ -in. studs extending through the collar and into the holes in the Chevrolet universal housing, as in Fig. 6. The coupling alone is not sufficient to properly brace the transmission, so a crossframe truss of angle iron is fitted into place as in Fig. 7. This holds the transmission by means of two long bolts, properly spaced by means of two $\frac{1}{2}$ -in. pipe nipples. A second trip to the machine shop is necessary to have the shaft splined as shown in Fig. 8. The heavy portion is already splined to fit the Ford truck differential of which it is a part, but the splines on the lower half must be machined to fit the Chevrolet universal, as shown in Fig. 12. Next, a $5\frac{3}{4}$ -in. length, cut from the rear of the Ford truck driveshaft housing, is brazed

to the Chevrolet universal housing, as in Fig. 13. The jointed parts are then bolted into place, as in Fig. 14, with the splined shaft inside. The final piece is the Ford truck differential, which is bolted to the shaft housing. A detail of the manner of supporting the differential is given in Fig. 15. A length of boiler plate, 6 in. wide by $\frac{1}{2}$ in. thick, is turned over at right angles, and the ends are cut out to fit over the axle, fastenings being steel straps twisted

to shape and bolted into position (Fig. 10). Fig. 16 shows the endpiece. The exact line on which to cut off the chassis is determined by this piece, the cut being made so that the endpiece can be bolted to the rear of the differential, as shown. Additional bracing is provided by the original truck trusses, which are cut to suitable size and bolted to the frame, as in Fig. 11. This completes the driveshaft assembly. The universal joints are not used for flexibility

angle iron. Fitting is best done by drilling the cleats first, then drill thirteen evenly spaced holes around the rim, and, finally, use a fit-and-try method to locate the remaining holes, as shown in Fig. 25. The cleats are fastened at an angle of about 45°.

The forward-wheel assembly includes the original Ford passenger-car axle, with wheels and rims, as shown in Fig. 17. The addition consists of two triangular wedges of

but only to insure simple and satisfactory couplings.

Now for the rear wheels. Each of these is made from a Ford passenger-car rear wheel, the original hub being removed and the hole for it enlarged with a file so that a truck hub may be substituted, as in Fig. 23. The latter should be placed so that the bolt holes of the hub will come between the old ones, in order to assure sufficient holding qualities. The outer part of each wheel is made from a $\frac{7}{16}$ by 6-in. iron band, bent to fit a Ford or Chevrolet rim and fastened with three bolts as shown in the right detail of Fig. 23. Each wheel is fitted with thirteen cleats which are 11 or 12-in. lengths of 2 by $2\frac{1}{2}$ -in.

boiler-plate stock, cut to the dimensions given in Fig. 20. The holes for the six bolts that hold these plates to the axle must be drilled very carefully so that the bolts will be tightly wedged into position. The slight swelling of the axle at this point will be sufficient to keep the plates firmly in place. Fastening the front wheels to the frame is accomplished by using two old-style front-frame bearings (Ford), which are bolted on either side of the frame as in Fig. 21. Such bearings can only be found on models up to and including the 1921 Ford. The opening in the lower bearing is fitted with a bushing, to take a $\frac{3}{4}$ -in. bolt, passing through the top of the triangular plates. The unit is

assembled as in Fig. 19, using lock washers under the nuts. As a tractor has a decided tendency to set nuts spinning, it is a good idea to use lock washers wherever possible throughout the entire assembly. One other thing about the front wheel assembly: For light truck farming, the original steering-gear tie-rod can be left in place, but if you anticipate heavy duty, you may as well remove this now as later and substitute a heavier rod. The strain on the rod, especially when the wheels are tipped in and out of a furrow, is considerable, and a light rod will usually buckle.

The rest of the job consists of finishing touches. You may use a standard tractor seat, fitting this into place with a fairly flexible length of steel, as in Fig. 18. Wood flooring is nailed over two lengths of 2 by 4-in. stock, preferably hardwood, bolted to the frame. The gas tank is mounted under the seat, and, in this position, allows a gravity feed to the carburetor. Starting is done by hand, with an ignition battery strapped into place behind the gas tank.

Although it adds nothing to the running qualities of the machine, a simple sheet-metal cowling will greatly improve its appearance. This should be made to run from the original dashboard back, with lighter lengths turned over at right angles, fitting over the frame at the front and along the flooring at the rear, as can be seen in the picture of the finished job. With this cowling, a wooden instrument board may be fitted neatly within the met-

al hood, as shown in Fig. 22. The original Ford hood can be used over the motor.

Two examples of hitches are shown in Figs. 9 and 22. The higher one is used for light loads, while the lower hitch is best for heavy loads. The upper one consists of a piece of heavy iron plate securely bolted to the rear crosspiece as shown in Fig. 15, while the lower one comprises several individual pieces, riveted or welded together, and is attached to the rear-axle housing. Running the tractor may be a little puzzling at first, especially if you have had no experience with a model-T Ford. With both transmissions in high, the tractor is simply a Ford truck with a $7\frac{1}{2}$ to 1 ratio between motor and rear wheels. There are, however, several intermediate combinations of gearing which will readily allow even the slowest plowing speed without stalling the motor. Normal tractor speed is obtained by putting the Ford transmission in high and the Chevrolet in first. One hour at the wheel will show what this tractor will do.

If the instructions given in this article are carefully followed, no difficulty will be experienced in building the tractor. You might question the fact that passenger-car wheels were used on a truck rear end, but this arrangement was found most practical as truck wheels were too small, being 3 in. less in diameter than the passenger-car wheels. When you have completed this tractor, you may be assured that it has plenty of power for average work, and will be found especially suitable for truck farming.

A New Exterior Improves Your Old Home

Old frame houses can be made attractive by simply remodeling the exterior. An effective combination is brick facing on the first floor with half-timbering and stucco on the second. With the exception of door and window frames, no alterations are necessary, the new exterior being built over the old. This construction not only beautifies the house, but the added insulation makes it warmer during winter and cooler in hot weather. First, a new concrete footing, about 8 in. wide and 12 in. high, is built along the old one, the top flush with the ground level. Next, the timber work is installed. Although

Old Homes Made Modern by Clothing Them with a Coat of Brick, Half-Timbering and Stucco, Which Also Improves Insulation

solid timbers are shown in the drawing, they may be built up of planks and adzed to give the hand-hewn effect. On the first floor, a layer of 15-lb. felt is applied over the siding, and on the second, 2 by 2-in. uprights are nailed to it, directly over the studs beneath. On these, lengths of No. 12 galvanized-iron wire are stretched horizontally, spaced about 6 in. apart, to prevent the tar paper, which is to be applied next, from sagging when stucco is put on. Wire mesh is laid over the tar paper to anchor the stucco. On the first floor, rough-surface brick is laid around the timber work, and, if desired, the work can be varied by laying in bricks of dark

tones here and there. For the brick construction brick ties are required, these being driven into the siding as shown in the illustration. In case both first and second stories are to be given a stucco finish, it is not necessary to carry the new exterior

so far out from the original siding. Instead of the 2 by 2-in. uprights, 2 by 1-in. slats can be used.

Correct Grinding for Lathe Tools

To get the utmost efficiency from tungsten-carbide lathe tools, they should be ground as follows: For general work, they should have a clearance of 7° , a tool angle of 72° , a top rake of 11° and a side or back slope of 4° . For hard iron, allow a clearance of 3° , a tool angle of 83° , a top rake of 4° and a side or back slope of 4° . For soft steel, they should have a clearance of 8° , a tool angle of 62° , a top rake of 20° and a side or back rake of 4° .

Made of a Hardwood Lever and Heavy Chain, This Fence Stretcher Will Be Useful for Heavy Work

Wire Stretcher for Heavy Work

Fastened to a well-braced post, this wire stretcher will be useful in work where considerable strength is required. A 10-ft. piece of 2 by 6-in. hardwood forms the lever, which has three holes drilled about 10 in. apart at one end to take clevises. A suitable length of chain for anchoring the stretcher to a post is fastened to the middle clevis, while 2½-ft. lengths, fitted with hooks, are fastened to the two others. Two pieces of 2 by 4-in. stock are clamped over the wire by means of bolts. The clamp is fitted with a chain as indicated. In use, the lever is moved back and forth, the loose hook being brought closer to the wire at the beginning of each stroke. —Floyd Mix, Chicago.

Oil-Soaked Leather Belting Easily Cleaned

Oil applied to leather belting to keep it pliable will in time cause it to slip. If the slippage is excessive, the belt will also become burned and will crack. To avoid this, improve the oiling conditions so there will be no leakage or spattering of the oil. Also use a belt that is as immune to oil as possible, and clean it periodically. A number of cleaning agents are available for this purpose, such as gasoline, naphtha, alcohol, etc. Coil the belt

loosely, immerse it in the cleaning fluid and leave it there overnight. Then remove the belt and allow it to dry for about 10 hours. Most of the dirt and grime will be loosened and will settle to the bottom of the container, but that remaining on the belt can usually be removed by brushing or scraping. When the belt is dry, lubricate it with a suitable dressing and it is ready for use again.

Trucks Approaching Doorway Ring Signal Bell

To prevent workmen from being hit by push trucks in a narrow shop doorway, I installed a signal by fastening two sheet-iron plates to the floor near the door opening on both sides. The plates were connected to a doorbell circuit so the wheels and axle of a truck passing over them closed it, ringing a bell and lighting a 3-volt red lamp over the entrance. The wiring and installations are shown in the drawing. A similar circuit was also adapted to the freight elevator, so that the trucks automatically called the operator as they approached the elevator. This method can also be used with rubber-tired trucks by attaching springs or chains to the axle to drag on the plates. —Geo. F. Read, Everett, Mass.

Trucks Passing over Metal Plates, Placed at Approach to Shop Door, Ring Signal Bell

Magnet Retrieves Small Parts in Auto Motor

For retrieving screws, nuts, etc., that have been dropped into places hard to reach, an electromagnet can be made from a discarded Ford coil connected to the electrical circuit of the car. Open the case, remove the secondary winding from the iron-wire core, but leave the primary winding intact. To the ends of this winding, solder two lengths of wire provided with spring clips. In use, one lead wire is clipped onto the positive terminal of the battery and the other is fastened to the motor or frame to provide a ground and complete the circuit through the coil.

Collapsible Stool for Window Trimmers and Merchants

Window trimmers will find this stool useful, as it is easily taken apart and occupies little space when packed. It can be made of wood or metal, and consists of two pieces, shaped as shown, one being slotted at the top and the other at the bot-

tom. A projection at the top of each edge holds the circular seat in position. If all parts have been correctly cut, the stool will be rigid.—E. A. Hoppman, Dumont, N. J.

Coloring Detects Glue Spots

As glue has a color so near that of natural wood, spots are often overlooked and not removed when finishing furniture. In order to be sure that all the spots would be seen and removed, a manufacturer used a vegetable dye to color the glue before using it. Dyes containing acids should not be used for this purpose, as the acid will interfere with the adhesive qualities of the glue.

Press marks on mohair-covered furniture are easily removed by rubbing with damp cheesecloth.

This Handle, Fitted to Tang of File, Insures Firm Grip When Surfacing Flat Work

Raised File Handle Prevents Injury to Fingers

When filing flat surfaces, the illustrated file handle will prevent injury to the hands. It is simply a length of soft iron or brass rod bent as shown. The rod should be large enough in diameter so that a slot can be filed in one end to fit the tang of the file securely. Both ends are bent over at right angles, about 2 in. from the end, to enable the user to grasp the tool comfortably.

Tool for Chipping Glass

Here is a tool that has been used successfully for chipping glass. It is a length of flat iron, having one end notched and cut out to the shape shown, the size of the notch depending on the thickness of the glass to be chipped. It is necessary to have a different size notch for each thickness. If the edge of the glass is cut evenly and a firm snap given to the tool for each notch, the broken-off chips will all be the same size.

Can You Solve *these* Puzzles?

By SAM LOYD

IN Siam, fish fighting is a popular sport. The fighters are usually a large perch, the kingfish, and a small carp, or devilfish. A kingfish can easily lick one or two of the devilfish, but three of the little fellows will hold him at bay. When four combine against a king, they will dispatch it in three minutes. Now let us pit thirteen of the devilfish against four of the kings. Puzzle: How long should that thirteen to four battle last?

MRS. Terwilliger said to her class: "The letter A represents a number of five figures. If you place the figure 1

before it, and multiply the number by 3, the product is A1. Now, what is A?"

CUT two parallel slits in a strip of leather or strong paper, and below them, a round hole. Fit with string and buttons as shown. Can you take the string and buttons out without tearing or untying anything?

Answers to Last Month's Puzzles

From what Mrs. Terwilliger told us last month, A must represent 2 and B, 5. With A in the ten-column and B in the units, the number AB may be expressed by 10A plus B. Reversing the order, we have 10B plus A, and this number was 2 more than twice the other. Doubling the first number and adding 2 we have 20A plus 2B plus 2, which equals 10B plus A, or, stated in another way, 19A plus 2 equals 8B. Now 2 is the only digit which, taken 19

times and added to 2, gives a number divisible by 8. Thus 40 divided by 8 makes B equal 5.

If the monkey climbed six feet up the rope, he would ascend three feet, the weight would ascend three feet and they both would stop four and one-half feet above the ground. The weight would already have pulled the monkey up eighteen inches.

A. W. Ford Pitney
Essex, N.Y.

"YANKEE"

Eleven-Inch

Hand Drill No. 1435 gives you
two speeds

PAYS you to buy "Yankee" Tools! They are "cheapest in the end," because they do things other tools can't. "Yankee" No. 1435 is the only small hand drill (eleven inches) that gives you high speed for fast work and then a shift to slow speed for easy drilling through. Saves drills; time. No jamming. Lets the amateur make holes like a professional: quick, smooth, free of burrs.

"Yankee" Ratchet Hand Drill No. 1530

For Work in Tight Places

Five adjustments including "Yankee" Double Ratchet for continuous drilling where crank can be moved only to and fro. Length, 10½ inches. Weight, 1¼ pounds. Three-jaw chuck; holds up to ¼ inch. Price, \$5.25.

See these ingenious drills at your tool dealer's. Use coupon below to get tool book.

No. 1555.—"Yankee" Ratchet Breast Drill. Length, 17". Three-jaw chuck; ½". Two speeds. Five adjustments; right and left ratchet; DOUBLE ratchet; plain drill; gears locked! Gives you the "feel" of the work. Price, \$11.00.

No. 1545.—Hand drill pattern. Capacity, ¾". \$10.00.

Fast or slow, or tool locked, at a finger touch, 11 inches. 19 ounces. Three-jaw chuck; ¼-in.

No. 1435.—
Price, \$4.50.

"YANKEE
VISE"

Chromium Plating over nickel on "Yankee" Tools now adds beauty and durability at no increase in price. Always like new!

NORTH BROS. MFG. CO.,
Philadelphia, U. S. A.

You may send "Yankee" Tool Book, showing eighteen styles of breast and hand drills, at \$3.00 up.

FATIGUE is the signal to rest; obey it if you can. When you can't, keep cool and carry-on in *comfort*.

Bayer Aspirin means freedom from those pains that nag at nerves and wear you down. One tablet will block that threatening headache while it is still just a threat. Take two or three tablets when you've caught a cold, and that's usually the end of it.

Carry Bayer Aspirin when you travel. Have some at home and keep some at the office. Like an efficient secretary, it often "saves the day," spares you many an uncomfortable, unproductive hour. It is harmless, so keep it handy, keep it in mind, use it freely. No man of affairs can afford to ignore the score and more of practical, *proven* uses the directions explain. From a grumbling tooth to the rheumatic pains that seem to bend the bones, Bayer Aspirin is ready with its immediate relief—and always works. Neuralgia. Neuritis. Rheumatism. Any nagging, needless pain.

Get the genuine tablets, stamped with the Bayer cross, for they are of perfect purity and do not affect the heart.

**"I didn't
get the job"**

HED counted on landing the job—but he missed out. Again he'll have to "stall" the landlord, the grocer and all the rest. One thing stood between him and a weekly pay check. His wife is somewhat reluctant to tell him. He doesn't realize that a fresh, close shave is important in getting and holding a job.

Far too many men *shave*, without being *clean* shaven. The blade you choose and the way you use it make the difference. Of course you can't shave your way to independence, but a fresh, immaculate appearance will help. On the other hand, the slightest growth of stubble is a handicap.

Today Gillette offers a new blade that makes close and frequent shaving easy and comfortable. It never roughens or irritates tender skin. Stubborn beard is sheared away quickly and smoothly. Try the new Gillette on our guarantee. You risk nothing. Buy a package and use two blades. If every shave isn't clean and pleasant—return the package to your dealer and he'll refund the entire purchase price.

Make Big Money This Year!

Be Independent! Have Your Own Business

SHARPENING lawn mowers by the Foley Electrakeen System gives you 99c PROFIT out of every dollar you take in. It is the chance of a lifetime for you. Here's exactly the thing you've been looking for, to make a clean-up this summer and have a well-established business of your own. Morse made \$1,520 in five months last year!

Foley Electrakeen Lawn Mower Sharpener

This remarkable machine sharpens all kinds and sizes of lawn mowers with the same method used by leading lawn mower manufacturers. Does a perfect job in from 15 to 20 minutes, sharpening all blades and the cutter bar in one operation—perfect alignment, perfect cutting. You get \$1.00 to \$1.50 a job—\$3 to \$5 an hour.

These Men Are Making Money!

J. H. Harbeck writes, "Last year I ground 1,289 mowers." R. E. Linkfield says, "I average 15 mowers a day, and people bring them from all over." . . . "Made enough money to pay for the machine and all expenses in three weeks," writes Walter Dambek.

Why don't YOU make BIG MONEY, too? You can buy a Foley on easy payments. Get started early. FREE PLAN tells you how. Send coupon TODAY!

There's only one genuine PLASTIC WOOD

—so refuse poor imitations

Science has perfected an amazing preparation that handles like soft putty and quickly hardens into wood—wood that lasts longer than natural wood—wood you can carve, paint and turn in a lathe. Wood that never dries out, never rots nor warps after it hardens. It is the best thing you can use for

repairing breaks, hiding nicks, sealing cracks. It does an expert job in a jiffy. **BUT BEWARE.** There's only one original. So avoid accepting imitations. If you want the very best at no additional cost—**DEMAND PLASTIC WOOD.** It is sold in 9 colors by all paint, hardware and department stores.

marvelous for modeling

Thousands of folks who never before worked with their hands are discovering what skilled artisans have known for a long time. With Plastic Wood they are making a thousand and one useful things—from fanciful dragons and proud galleons to book-ends and mirror frames. Many are now making extra money this way. If you want some fun—try your hand at modeling with Plastic Wood. You'll get a thrill!

BIG 48-PAGE BOOK FREE

We'll send you **FREE** for the asking—a 48-page, profusely illustrated book crammed full of facts about Plastic Wood. Tells how to use this amazing preparation.

LARGEST RARE COIN ESTABLISHMENT IN U. S.

**I PAID HIM \$200.00
FOR JUST ONE
COPPER CENT**

OLD MONEY AND STAMPS WANTED

**He
Writes:**

"Please accept my thanks for your check for \$200.00 in payment for the copper cent I sent you. I appreciate the interest you have given this transaction. It's a pleasure to do business with a firm that handles matters as you do. It will be a pleasure to sell my friends of your wonderful offer for old coins."

Julian D. Martin, Virginia

This is but one of many similar letters we are constantly receiving. Post yourself! It pays! I paid Mr. Manning, New York, \$2,500.00 for a single silver dollar. Mrs. G. F. Adams, Ohio, received \$740.00 for some old coins. I paid J. T. Neville, of North Dakota, \$200.00 for a \$40.00 bill picked up in circulation. In the last thirty years I have paid hundreds of others handsome premiums for old bills and coins.

All Kinds of Old Coins, Medals, Bills and Stamps Wanted

\$1.00 to \$5,000.00 paid for certain old cents, nickels, dimes, quarters, etc. Right now I will pay \$50.00 for 1913 Liberty Head nickels (not buffalo); \$250.00 for 1894 dimes "S" Mint; \$5.00 for 1853 quarters, no arrows; \$10.00 for 1866 quarters, no motto; \$200.00 for 1884 and 1885 Silver Trade Dollars, etc.

Big Cash Premiums for Hundreds of Coins Now Circulating

There are literally thousands of old coins and bills I want at once and for which I will pay big cash premiums. Many of these are now passing from hand to hand in circulation. Coin collectors are anxious to secure these coins and are willing to pay handsomely to get them. Today or tomorrow a valuable coin may come into your possession. Watch your change. Know what to look for.

It Pays to Post Yourself on Coin and Stamp Values

Knowing about coins pays. Andrew Henry, of Idaho, was paid \$900.00 for a half dollar received in change. I paid Mrs. Dowry, of Texas, \$400.00 for just one half dollar. A valuable coin may come into your possession or you may have one now and not know it. Post yourself.

Some old stamps bring big premiums. An old 10c stamp, found in an old basket, was sold for \$10,000.00. There may be valuable stamps on some of your old letters. It will pay you to know how to recognize them.

Send Coupon for My Big, Illustrated Coin Folder! It Will Open Your Eyes!

Send the coupon above and 4 cents for my Large, Illustrated Coin and Stamp Folder and further particulars. Write today for this eye-opening, valuable wealth of information on the profits that have been made from old money. No obligation on your part. You have nothing to lose—everything to gain. It may mean much profit to you.

MAKING WATERTIGHT JOINTS

between different materials—glass, wood, metal, slate, masonry, etc.

PROFESSIONAL builders of aquariums ranging from the big public ones in New York and Washington to little home types for one or two goldfish, use and recommend Smooth-On No. 6 as the easily applied permanently effective material for setting the glass watertightly in the metal frames and for making repairs.

Smooth-On No. 6 is a plastic iron putty, ready for use, and applied with knife or trowel. It hardens slowly, bonds perfectly between materials of widely differing composition, does not shrink or draw away from the joint, and is not affected by heat, cold, sun, rain or snow.

Use it for placing and resetting glass against metal or wood in window sash, skylights, vault-light frames, for avoiding leakage at chimney and roof flashings, for setting and weatherproof filling of joints between metal plates, wood, slate, paving flagstones, concrete blocks, etc., where hard, smooth surface is desired. Excellent for water-

proof filling of seams, rivet heads and rough spots on iron and steel plate constructions.

Nine kinds of Smooth-On, each for specific purposes, are described in the Smooth-On Repair Book, which also tells where and how to use each with perfect success and big savings.

Mail the coupon for a free copy and get Smooth-On in 7-ounce or 1 or 5-pound run from any hardware store or direct from us.

What you can do —

with this SAMPLE of CASCO Waterproof Glue

Things you didn't think you could glue, now put together forever with this wonder-working glue. CASCO is just a dry powder which is mixed with cold water in a few minutes into a liquid glue that sets permanently, like concrete—heat-proof and moisture-proof.

RESISTS WATER ON TABLE TOP

"Used your CASCO for gluing a top on a kitchen table. It is washed or wiped every day, but the glue has not loosened any."

—G. A. M., Ellington, N. Y.

REPAIRED VIOLIN

"Had trouble with my violin not holding together in this damp climate. Sent it to New York for regluing several times without success. A friend suggested I try CASCO. When my fingerboard came loose, I glued it on with CASCO and it is holding better than my previous gluing."

—C. H. A., Charleston, S. C.

MAIL THIS COUPON

Receive Glue Sample and Folder of Uses

Take this generous sample of CASCO Waterproof Glue and see for yourself the many jobs you can do with this glue that you could never do with any other glue. Just mail the coupon and ten cents—NOW!

Turn your spare time into CASH with the new IDEAL « Lawnmower Sharpener

What these men have done, YOU CAN DO!

Walter Wever, Middletown, N. Y., writes: "I have made over \$1,000.00 on my Ideal Lawnmower Sharpener during the past four months." W. T. Moore, Twin Falls, Idaho, writes: "Through the season of about 90 days my Ideal has netted me a profit of \$1,200.00." Ralph L. Lemont, Ocean City, N. J., writes: "My Ideal was the means of making me \$1,500.00 this past season."

Big Profits in Your Spare Time

C. S. Coburn, North Little Rock, Ark., writes: "With my Ideal Sharpener, working evenings only, I took in \$1,965.20 in 18 months—sufficient to pay for my Ideal and equip my shop with new, modern machinery." W. F. Kendt, Buffalo, N. Y., writes: "I sharpened 994 lawnmowers last season and the receipts were nearly \$2,100.00—not bad for a side-line." H. Armstrong, Vancouver, B. C., writes: "This year, with business conditions poor, I sharpened 1,000 mowers. The Ideal is a very good machine and I hope 1932 will bring better business to all of us."

A Permanent Paying Business

S. E. Raup, Harrisburg, Pa., writes: "I started sharpening lawnmowers 5 years ago, as a side line, setting up an Ideal in my basement. Now I am arranging to build a large shop and apartment to take care of my increasing business which employs 2 to 3 men besides myself." Don't lose any time getting into this highly profitable business. The earlier you start, the more business you will do—THIS YEAR.

No Training Required

You don't have to be a mechanic to operate the Ideal. Its operation is simple and practically automatic after you have placed the lawnmower in position to grind.

Here Is Your Chance

THE BIG OPPORTUNITY YOU HAVE ALWAYS WANTED—TO MAKE EXTRA MONEY. Send for the new free handsomely illustrated catalog "Turn Your Spare Time Into Cash." It also shows you the best ways to get the mowers to sharpen. Don't wait. Clip the coupon NOW!

New

The new 1932 model Ideal Lawnmower Sharpener—with direct-connected electric motor and shaft—new variable-feed grinding method—new Reconditioner for "lapping in"—new straight-blade attachment for grinding both faces of straight-blade—the greatest value ever offered.

A TWO-METHOD Sharpener—a Grinder and a Reconditioner—at Practically the Price of One

The new 1932 model Ideal Lawnmower Sharpener meets every possible condition—it is the ONLY machine that GRINDS and puts a perfect bevel and cutting edge on the old, dull, thick-bladed, hard-running mowers and also Sharpens or Reconditions the new, slightly-dull, easy-running kind.

Sharpens Any Mower in 15 to 20 Minutes

Just pick up the mower, set it in the Ideal, make a few simple adjustments and proceed to sharpen. In 15 to 20 minutes after you pick up the mower it is ready for the lawn, and you have made \$1.00, \$1.50 or \$2.00, depending on the condition of the mower.

Special Grinding Wheel Attachment

For grinding skates, grass shears, sickles, etc. Will add many dollars to your income.

Uses Little Power

Operated by $\frac{1}{2}$ H. P. motor attached to light socket or may be run direct from line shaft.

Be Your Own Boss

Work for yourself. Be independent. Hundreds of lawnmowers are waiting to be sharpened. No town too small. Our new, free catalog shows you how to make money from the very start.

You may have opportunity. A plan whereby you

Shop Pays for Itself

We advertise nationally. Inquiries pour in from all sections. We forward names of interested men to our demonstrators. No canvassing. No collecting. You show and we sell. Write for particulars.

Here is the saw sensation of 1932.

A saw that mitres, bevels, dados, grooves and rabbets while the table stays in one position at all times—rigid and level. Lumber remains level regardless of operation. No slipping. No wedging. No binding. All kinds of cuts made safely, accurately and easily. Highly polished 15" x 17 1/2" table, also 20" x 27 1/2" table; capacity 2 1/2" with 9" saw; mortising capacity 1/2". No shop complete or up-to-date without this new and improved saw.

\$32.50

A real buy at.....

12" Band Saw only \$30

(Levs Guards)

How to

Build Your Bench

Work-Table, Saw Horse, Tool Box & Cabinet

BUILDING your own shop furniture is so easy it's FUN, when you are guided by this new ATKINS book for home craftsmen. Pages 18 to 22 give you full instructions and working diagrams to build a complete shop outfit—saw horses, folding table, workbench, tool box, wall cabinet, mitre box and saw case. It tells you how to cut the parts, put them together, and finish the job. And to help you make good joints, the book shows how to cut and fit the 24 types used most in shop wood-working.

Eight other helpful chapters in this new handbook! They deal with: Pleasure and profit in a home shop; how to lay out and equip a shop; select tools and machines, and choose woods; where to obtain 450 job plans; easy ways to cut and work metals; do grinding and filing; books for shop workers; and gives you facts on fifty "Silver Steel" saws, to do all your cutting jobs faster and easier.

This how-to-do-it book is helping thousands of men and boys get more fun and profit out of their home shops and tools. It has 40 pages, size 6 x 9", and costs only 10c. Send coupon for a copy of the 1932 edition, now.

If your dealer does not have the Atkins Saws you want, write us.

Into a trunk, under the bed, under a table, back of the door, into a desk at school, or anywhere. You get lots of fun fooling the teacher, policemen, peddlers, and surprise and fool all your friends besides.

THE VENTRILO

is a little instrument that fits in the mouth out of sight. Cannot be detected. It is used in connection with the above, and with the aid of this wonderful DOUBLE

THROAT, or VENTRILO, you can imitate many kinds of birds, animals, etc. Remember you get everything for **ONLY TEN CENTS**—a booklet giving you full instructions how to become a ventriloquist and throw your voice, the Double Throat, or Ventrilo, and our big page catalog of novelties, tricks, puzzles, jokes, books, etc., **10 cents** ALL SENT POSTPAID TO ANY ADDRESS FOR ONLY

Johnson Smith & Co.
Dept. 823
Racine, Wis.

BLANK CARTRIDGE PISTOL

This well made and effective pistol is provided with the pattern of the latest type of the pistol, the appearance of which is enough to make a burglar, thief, when loaded, it will probably prove just as effective as a revolver with real bullets without the danger to life. It takes the standard .32 Calibre Blank Cartridges, that are obtainable most everywhere. Special cash with order offer: 1 superior quality Blank Cartridge Pistol, 100 Blank Cartridges, and our new 350-page Deluxe Catalog of latest novelties all for **ONLY \$1.50**. Shipped by express only. Cannot go by parcel post. Extra Blank Cartridges 50c per 100. Remember it is quite harmless, as it will not accommodate loaded cartridges. Special Catalog (Covering Type for pistol) 30c. No C. O. D. Shipments. **Johnson Smith & Co.**

Special Offer 100 Blank Cartridges, 100 Blank Cartridges, 100-page Novelty Catalog **ONLY \$1.50** Lot shipped by Express Only Cash with Order Only

MAGICIAN'S BOX OF TRICKS

Apparatus and Directions for a Number of Mysterious Tricks, Enough for an Entire Evening's Entertainment. **\$1.00**

IF ANYONE CAN DO THEM

It is great fun mystifying your friends. List this **CONJURER'S CABINET**, and you will be the cleverest fellow in your district. It contains the apparatus for ten different tricks, including THE MAGIC BALL AND YARE TRICK (a wooden ball is placed inside, and upon replacing the lid has disappeared and is found in someone's pocket); THE HINDOO TRICK CARDS (a card is made to change completely in less than five times); THE GREAT COIN BOX (a coin, placed in the wooden box, vanishes entirely or changes into a coin of another denomination); THE GLASS GLOBE (a globe is dropped into a glass of water and when the water is poured out the globe has vanished and is found somewhere else); THE RUBBER FACTORY PRIZE (a small rubber factory is made to supply of colored paper ribbons comes out of your pocket); THE DISAPPEARING HANDBAG (a handbag is placed in the hand mysteriously vanishes); THE WIZARD'S RING COIN TRICK (a ring is placed in the hand and the hand is able to make it lay down); THE GREAT HAT AND DICE TRICK (a large dice is placed on top of a hat, disappears, and is found underneath the hat, or two from the hat, and the hat, but not least, the GREAT PHANTOM CARDS (a card is made to change completely in less than five times). Full instructions are sent for performing each trick. In addition to the above, a number of other facts and situations are fully explained for which you can easily make the necessary apparatus. Price complete **\$1.00** postpaid. **JOHNSON SMITH & CO.**

U. S. BABY TANK

25 Cents

It goes with real Yankee Pep—by its own power. Most remarkable toy ever invented. By drawing the Tank backward, water with the lead or over the floor or table and then placing it down, it will travel along, overcoming all obstacles, in the same lifelike manner as the largest tank that moved so readily in the great war. What makes it go is a marvel of a mystery, for there is no mechanism to wind up as is usually understood with mechanical toys, yet this tank will keep plodding along as long longer than the ordinary run of toys. It will perform dozens of the most wonderful stunts. **Price 25c** prepaid. Stamps accepted. **JOHNSON SMITH & CO., Dept. 823 Racine**

The "Little Giant" Typewriter

A First Class Writing Machine For \$1.50

A perfect little typewriter for \$1.50. There are thousands of persons who would like to see a typewriter but more needs and cannot do so. Now the little Giant, attached to the typewriter and use of a slip on safety-line dollar machine. To such persons we confidently recommend our Little Giant. It is strongly made, but simple in construction, so that anyone can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet most frequently used are so grouped as to enable one to write rapidly, the numbers 1 to 10, and the punctuation marks being together. With this machine you can send your best and typewritten letters, address envelopes, make out bills, and do almost any kind of work not requiring a large, expensive machine. Price complete **\$1.50** by mail postpaid to any address in the world. Stamps accepted.

BOY ELECTRICIAN Great Book for Boys, 10c Postpaid

The HOW and WHY of electricity fully told in simple language that any boy can understand. Scores of plans and instructions for making—dry batteries, dynamo, electric motor, telegraph apparatus, telephones, electric light, electric door bells, alarm, electric train, theorems, wall box alarm, electric-saw, automatic hand-saw, flash, electric-shocking machine, wireless telegraph apparatus, induction coil, arc light, exhaust receiver, etc., etc. Tells all about electric wiring, static electricity, magnets, and induction, electromagnetism, and induction, electrostatic induction, the lightning, the electroplating, the electrolysis, the dynamo, the motor, the battery, the electric light, the electric bell, the electric train, the electric saw, the electric hand-saw, the electric flash, the electric shocking machine, the wireless telegraph apparatus, the induction coil, the arc light, the exhaust receiver, etc., etc. Also tells how to build a radio receiver and for a few cents. Nearly 100 illustrations. Sent postpaid to any address on receipt of **ONLY 10c**, price of stamps.

MAGIC MADE EASY 250 MAGIC TRICKS 10c

For Parlor or Stage

An excellent little book containing nearly 300 Tricks for parlor or stage. Tricks with cards, coins, handkerchiefs, eggs, rings, glasses, flowers, children, spoons, bottles, etc. Explains the mystery of the floating head and scores of other amazing feats of magic and illusions. Also Second Sight, Shadowgraphy, etc. In simple a child can perform them. Fully illustrated. **ONLY 10c**.

128 CARD TRICKS and sleight of hand. Covers all the latest and best card tricks as performed by celebrated magicians, with extensive list of card tricks used by professional cardists. Price 25c

RAPID CIGARETTE MAKER

RAPID CIGARETTE MAKER

ROLL YOUR OWN SAVE MONEY

With this **AUTOMATIC CIGARETTE MAKER** you can make your own cigarettes from your favorite brand of tobacco and save money besides. It takes but a few seconds. Better cigarettes at about one-fourth the cost. Simplicity itself to use. It is neat, useful and handy. Pocket size, weighs but half an ounce. Case is made entirely of metal, nickel plated. Full printed instructions with each Cigarette Maker. Pays for itself in no time at all. **PRICE ONLY 25 CENTS POSTPAID.** 3 for 65 cents; or 1 dozen for \$2.25 postpaid

PATE

Protect Your Ideas

Take the First Step Today

If you have a useful, practical, novel idea for any new article or for an improvement on an old one, you should communicate with a competent Registered Patent Attorney AT ONCE. Every year thousands of applications for patents are filed in the U. S. Patent Office. Frequently two or more applications are made for the same or substantially the same idea (even though the inventors may live in different sections of the country and be entirely unknown to one another). In such a case, the burden of proof rests upon the last application filed. Delays of even a few days in filing the application sometimes mean the loss of a patent. So lose no time. Get in touch with me at once by mailing the coupon on the opposite page.

Prompt, Careful, Efficient Service

This large, experienced organization devotes its entire time and attention to patent and trade mark cases. Our offices are directly across the street from the U. S. Patent Office. We understand the technicalities of patent law. We know the rules and requirements of the Patent Office. We can proceed in the quickest, safest and best ways in preparing an application for a patent covering your idea. Our success has been built on the strength of careful, efficient, satisfactory service to inventors and trademark owners located in every state in the Union.

NO CHARGE for Information On How to Proceed

The booklet shown here contains valuable information relating to patent procedure that every inventor should have. And with it I will also send you my "Record of Invention" form on which you can sketch your idea and establish its date before a witness. Such evidence may later prove valuable to you. Simply mail the coupon and I will send you the booklet, and the "Record of Invention" form, together with detailed information on how to proceed and the costs involved. Do this NOW. No need to lose a minute's time. The coupon will bring you complete information entirely without charge or obligation.

My Offices
Just Across
Street From
U.S. Pat. Office

Above is a view of my drafting and specification offices where a large staff of experienced experts is in my constant employ. All drawings and specifications are prepared in my offices.

NEWS

Inventors Write for these Free Books

Strict Secrecy Preserved

All communications, sketches, drawings, etc., are held in strictest confidence in strong, steel, fireproof files, which are accessible only to authorized members of my staff. Feel free to write me fully and frankly. It is probable that I can help you. Highest references. But **FIRST**—clip the coupon and get my free book. Do **THAT** right now.

Clarence A. O'Brien

"How to Obtain a PATE This FREE BOOK Tells You How to Protect Your Invention

**Delays in Patenting Your Idea May Prove Costly
Get the Facts—Mail Coupon NOW!**

Little Ideas May Have Big Commercial Possibilities

ACT AT ONCE—and protect your idea. Remember, to get the benefits of your invention, you not only have to invent it—you have to **PATENT** it. Many men spend years perfecting an invention, only to find that someone else thinking along the same lines has already received a patent on the idea. When we think of all such cases that have come under our personal observation, we cannot urge too strongly that you take steps to protect your idea **IMMEDIATELY**. Delays of only a few days may be vitally important to you. Do not lose all the benefits of your hard work in planning and perfecting your invention.

Mail the Coupon for FREE Book Today

It is of tremendous importance that you file your application for a patent at once. Our free book tells you **HOW** to take the first steps, what you need to know about patents in general and gives you an estimate of our reasonable fees. We also send you a "Record of Invention Blank" **FREE**. Take the first step toward getting your patent **NOW**. Mail coupon at once.

Highest References—Strictest Secrecy 33 Years of Proven Service

Victor J. Evans & Company are registered Patent Attorneys, practicing before the U. S. Patent Office and Federal Courts. We handle only patent and trademark matters, thus giving you the benefit of specialized experience. In our 33 years of practice, we have successfully served thousands of inventors. Strictest secrecy is maintained, all drawings and records being kept in our files, to which only our attorneys have access.

Here's How We Operate

As soon as the description of your invention comes into our office, it is immediately put in charge of an attorney, who is particularly familiar with the kind of invention you have perfected. Under his close personal supervision, patent searchers and skilled draftsmen work. He personally sees your case through to its conclusion. In short, you have the advantage of highly skilled and experienced service.

Our Washington Location Advantages

It is a distinct advantage to an inventor to employ an attorney located in Washington, as the U. S. Patent Office has no branches. Only in Washington can an attorney have convenient access to the records of the Patent Office. Our close proximity to the Patent Office enables us, without loss of time, to interview the officials and examiners whenever, in our opinion, our clients' interest will be best served by such a course.

VIOLETTA *High Frequency Ray Relieves Pain and Promotes Health*

Thousands of men and women suffering from rheumatism, paralysis, neuritis, nervousness, skin diseases, headaches, constipation, sprains, prostate trouble, gout and many other ailments, even hay fever and asthma, have found quick relief, renewed health and vitality with this marvelous invention. Pains vanish almost instantly.

It was Nicola Tesla who discovered that electricity from an ordinary light socket when stepped up to high frequency and passed through a vacuum tube could be broken up into penetrating electrical mist and utilized as a curative agent with amazing results.

These high frequency electrical currents giving off the familiar violet glow as the electrons bombard their way through the vacuum, stimulate and normalize the "life processes" of the living cell with which they come in contact, and thus relieve pain, eliminate congestion, promote circulation and restore the functions of sluggish organs—and they do this painlessly and harmlessly and so quickly and effectively it will surprise you.

VIOLETTA \$11.00 The Greatest of No. 3112 Home Remedies

VIOLETTA No. 3112 is a complete high frequency electrical outfit for the home with all the power and versatility of machines sold at many times the price. Our TEN DAY TRIAL offer will convince you of its wide range of usefulness from the relief of pain and congestion to the beautifying of hair and complexion.

Our FREE Booklet will tell you all about the VIOLETTA High Frequency Ray and the ailments it relieves, how it beautifies better than cosmetics and how easy it is to own a VIOLETTA and have it handy for immediate use when needed. Fill out and mail the coupon TODAY.

Make a TRACTOR from Your OLD CAR

GREATLY REDUCED PRICES

To meet present conditions, we have greatly reduced prices on SHAW Tractor Equipment. Get your SHAW Equipment now and build tractor during spare time—or buy it complete.

EASY TO BUILD WE TELL YOU HOW

For Model "T" and "A" Fords, Chevrolets and other make cars.

**BUILD
YOUR OWN**
tractor during
spare time and
have it ready
for use when
needed!

Cuts Your Production Cost!

Front view of SHAW Tractorized Model "A" Ford. Shows New HIGH ARCH, allowing for clearance of tall corn, cultivating 1 to 2 rows at one time. Regular cutfeeder beams may be used.

MAKE more money! Do it by making a powerful, dependable tractor from your old Ford, Chevrolet or other old car—with sturdy SHAW Tractor Equipment. The SHAW Tractorized Car, by saving valuable time and costly labor, greatly lowers production cost. Pays for itself in one season!

Amazing All-Around Performance—Does more for small amount of money invested than any other tractor. Tests have proved it does all farm power work as well as expensive tractor. Cultivates 15 to 20 acres per day. Turns about 5 to 10 acres per day with mold-board plow. Handles 10-in. plow, or two 12-in. plows nicely. Easily pulls heavy, steel road drag. Can also be used to seed, harrow, furrow, harvest, haul; run log saws, feed grinders, concrete mixers, pumps and other belt machinery.

Low Cost—You can have a SHAW Tractor at surprisingly low cost—on Easy Payments. SHAW Tractor Equipment costs very little—at New Reduced Factory-to-You Price. If you haven't an old car, you can pick up an old Model "T" Ford or Chevrolet for \$5 to \$25; or a Model "A" Ford chassis, which has had the body wrecked, very cheaply. Many Model "A" Fords are now being converted into SHAW Tractors. SHAW Equipment, bought now for a Model "T" Ford, can later be installed on a Model "A." Many attach SHAW Equipment to other makes of cars.

Anyone Can Attach SHAW Equipment quickly and easily, using only monkey wrench and screw driver. You don't have to be a mechanic. We furnish all parts, easy-to-follow directions. Can be attached to full-length or snubbed-off chassis.

Make Tractor Now—Remember Reduced Price is subject to change any day. So make your tractor now. **SAVE MONEY!** Mail Coupon for full information—TODAY!

SHAW MFG. COMPANY

easy AS LIGHTING THE LIGHT!

What? You've never tried to be your own radio expert? Well... get going now, with Kester Radio Solder. It's *easy*, and it's absolutely safe. Look... all you have to do is apply heat, then go to work, because Kester carries its flux inside itself. This flux is *plastic* rosin, too. Non-corrosive. A non-conductor. It prevents electrical leakage thereby aiding receptivity. You can *hear* the difference!

Buy a handy can of Kester Radio Solder from your radio store or other dealers. Write for free booklet "The A-B-C of Soldering."

MAGIC FLUID

COL-GRA'PHOIDS MOTORS

PLATED LUBRICATION

saves on Gasoline, Oil & Motor Expense

AUTOMOBILE, Airplane, Tractor, Truck and Machinery Owners! Think of it! A revolutionary discovery now "plates" lubrication on all moving parts. Automobile owners, airplane pilots, engineers and other Col-gra users, are amazed at its action. "Like Magic" is the best description of it.

REVOLUTIONARY DISCOVERY

Added to the oil and gasoline, Col-gra seeks all friction parts, where under heat, speed and pressure, it quickly forms an almost frictionless Col-gra'phoid surface. This means smoothness—quicker acceleration—amazing savings on gas, oil and repairs.

PROVEN BY TESTS

On a recent test of a Col-gra'phoided motor, four engineers ran an automobile, without the slightest motor injury, for 29 miles without oil, proving beyond all doubt the ability of this surface to lubricate even in the complete absence of oil. Laboratory tests further show the amazing difference between treated and untreated friction surfaces.

PAYS FOR ITSELF

Because Col-gra reduces friction, gives more power, frees valve action, reduces carbon, heat and wear, and prevents bare metal-to-metal contact, it gives motorists many added miles with less cost. Col-gra quickly pays for itself many times over in savings on repairs, motor fuel, oil, starter and battery.

SALESMEN AND DISTRIBUTORS

Good Territory Open

Wonderful opportunity for salesmen and distributors. Earnings up to \$100.00 a week and more. Valuable territory still open. For complete information check and mail the coupon.

THE COL-GRA COMPANY

Dept. 1504, 2621 N. 3rd St., Milwaukee, Wis.

SNAPPY WINTER STARTING

In cold weather when the oil is too thick to flow or too thin to lubricate properly, Col-gra'phoid surfaces provide snappy winter starting. Reduces bare metal-to-metal friction—prevents serious damage.

MORE POWER - PEP - SPEED

Col-gra users everywhere are enthusiastic. "I am pleased with results," writes Frank Eastwood. "The motor's smoothness is almost beyond belief. My mechanic says it can't be the same engine." Paul Canalizon: "Col-gra gives the car more power—speed—pep and gas mileage." W. P. Barrows: "My car runs much smoother, uses less oil and has more pep." E. C. Bergman: "Col-gra helps the motor a whole lot—is working more freely and less vibration."

HEAT AND COLD PROOF

Col-gra's patented ingredients manufactured at 7500° assure positive lubrication. No motor heat too great. No temperature too cold—lubricates at 100° below zero. Gasoline cannot wash it off. It stays put!

Why spend money needlessly for gasoline, oil and repairs—why operate your motor just partly efficient? Find out all about this magic fluid "Col-gra" now and let it start saving money for you.

FREE OFFER COUPON!

THE COL-GRA COMPANY,
Dept. 1504, 2621 N. Third St., Milwaukee, Wis.

Mystery "TWIN-RAY" Light Tested— Reads Newspaper At 1,000 Feet!

SEVERE TEST GIVEN NEW SAFETY LIGHT

June 8th: A demonstration of the new Auto Safety Light, designed for safe night driving, was given at the Boston airport on Friday night before an interested gathering of pilots and automobilists. The first test was the ability to read this part of a newspaper at a point of 1,000 feet in front of the light and a foot above the ground, proving thereby the ground in front of the light was perfectly illuminated, the rays from the light were at no point above the center of the light itself. Consequently there would be no glare to an on-coming car. Showing the light powerful enough to penetrate the lights of the on-coming car and show clearly the road beyond and any obstacles in it.

Lights Highway Ahead With 67,000 Candle Power Beam

Reporters for the Boston Sunday Post witnessed a demonstration of this light and above is a reprint of their report.

Now—judge for yourself what you can do with a light like this on your automobile—a light that throws a 67,000 candle power beam, for over 1,000 feet—lights up all road signs and curves long before you reach them. Makes the road ahead of you as bright as day yet absolutely can't glare in the eyes of approaching drivers. A road light that literally takes the light

out of the sky—all light on the highway. Fast night driving now safe with this amazing Speedlight—you can drive 60-80—even 70 miles an hour with perfect safety. On a road as brilliantly lighted at midnight as at mid-day. Cuts through fog, rain, and darkness. This "twin-ray" road light not only can't glare itself but it cuts through on-coming brights. No wonder it was awarded the grand prize and two gold medals in world competition.

AGENTS Cleaning Huge Profits

Agents and distributors from coast to coast are making big money equipping passenger cars, buses and trucks with this brand new road light. This is your opportunity to make up to \$10-\$20-\$30 per day. Some agents make even more. Many made \$90 in a few hours. Most made \$450 in one day. Burroughs sold fifty lights to Richmond fire and police departments. Over 20 million cars need

this wonderful light to protect human lives and property against glaring lights, fog, rain and darkness. Hundreds of men have made big fortunes out of makeshift spot lights and painted bulbs that only did half the job. Send the coupon and find out how you can use this great device to build up a crew of your own—and double your earnings—earnings which by themselves will be bigger than you ever saw before. Do it now, before you turn this page.

Cuts Through London Fog and Darkness Like a Knife

Tests in England have proved this. With this light you need have no more fear of fog, rain or darkness. There is no light like it in the world. It is not a spot. It embodies an absolutely new principle in headlighting discovered by a famous light engineer, NOT A PAINTED BULB—but a real scientifically constructed road light with a concentrated 67,000 candle power beam of light on the road for over a thousand feet and no glare. Think of it! Over a fifth of a mile. Put one on your car and see for yourself what you can do with a light like this. Send the coupon today for our introductory offer.

ANNOUNCING *The*

NEW

DOUBLE ACTION SUPER- LUX!

Amazing Magic Disc Boils Water in Split Seconds!

AND PAYS AGENTS **UP TO \$20..\$30..\$40 IN A DAY**

AT LAST the great news is out! The new Super-Lux Double-Action Water Heater is ready! Now hot water—boiling, steaming, hot in less time than ever before! Even the amazing 1931 Lux has been surpassed by this new scientific marvel. Five major improvements and many minor refinements put this sensational device absolutely in a class by itself— miles ahead of any similar heater money can buy.

5 Amazing Improvements!

First of all (1) the new Super-Lux sets a new standard for appearance with a flashing chromium outer shell that is useful as well as ornamental. By an exclusive new process, color is actually plated on, becoming a part of the metal and protects it against pitting, scarring and corrosion. (2) An improved cord with extra heavy wires makes overheating impossible and a special insulation that will not soften or crack in hot water. (3) Instead of bronze or copper screws and fittings, the new Lux uses a special alloy that will not corrode or turn green; water heated with it can safely be used for cooking. (4) The heating element, too, is made heavier and of a new material that adds months, even years, to the useful life of the heater.

Most important of all, is (5) the amazing double-action heating principle—an exclusive Super-Lux feature! Makes possible hitherto unobtainable speed and efficiency. Simply drop the new Super-Lux in a pan of water, turn on the current and, almost instantly the water is seething, bubbling, boiling furiously. You simply have to see it in action to realize its voluminous intensity and speed of action. And, remember, the only way to enjoy all these advantages is to own the new Super-Lux. No matter how much or how little hot water you use, you need this amazing invention!

Triples Profits for Agents

Why not investigate today—read what it will do. More important still, look into its astounding money earning power. Learn why men who never made more than \$10 a day in a day before now reach \$20—\$30—\$40 or more with ease! No experience or special sales ability needed—a simple 90-second demonstration is all it takes. For people know the name LUX—know this company as the pioneer manufacturers of this type of heater—know that the means means quality—service—VALUE! An improved Lux, therefore, all but sells itself. Investigate NOW!

MAIL COUPON TODAY

For Description of the New Super-Lux and amazing proof of sensational, big money opportunity!

**\$195.00
IN TEN DAYS**

How would you like to make \$195 in 10 days? C. L. Neuman (Ind.) has shown that it can be done. Read what he says: "I have sold 156 (made \$195) in 10 days. No trouble in selling them!" But Neuman is only one of many who find sensationally big profits amazingly easy to make. Send the coupon below for free proof of extraordinary opportunity.

\$41.25 in One Day

Send another sensational achievement. J. Smith (Mo.) secured \$41.25 in one day with the Lux Water Heater! Your territory is just as promising as Smith's or any other. So, don't fail to mail that coupon TODAY!
